## NOTICE

The information in this document is subject to change, as the Company may make changes to product in order to improve reliability, design, or function, without prior written notice. No part of this manual may be reproduced or transmitted in any form or by any means without the written permission of the company.

**IN NO EVENT WILL THE COMPANY BE LIABLE FOR SPECIAL INCIDENTAL OR CONSEQUENTIAL DAMAGES, WHETHER ARISING DIRECTLY OR INDIRECTLY, SUCH AS LOSS OF PROFIT OR GOOD WILL, THAT MAY BE SUFFERED IN CONNECTION WITH THE PURCHASE OF THIS PRODUCT OR FROM THE BREACH OF ANY REPRESENTATION OR WARRANTY.**

June, 1998

## LIMITED WARRANTY

This product is warranted against defects in materials and workmanship for a period of one year from the date of purchase. During the warranty period, product which the Company determines fails to meet warrant will be repaired or, at the Company's option, replaced at no charge. To be eligible for warranty service, product must be returned to the Company or to a Company authorized service center, costs of shipping prepaid. This warranty does not cover results of accident, abuse, neglect, use contrary to specifications or instructions, or repair or modification by anyone other than the Company.

**THE COMPANY SPECIFICALLY DISCLAIMS ALL OTHER EXPRESS, IMPLIED OR STATUTORY WARRANTIES, INCLUDING THE IMPLIED WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE AND MERCHANTABILITY. IF SUCH DISCLAIMER OF ANY IMPLIED WARRANTY IS NOT PERMITTED BY LAW, THE DURATION OF ANY SUCH IMPLIED WARRANTIES IS LIMITED TO 90 DAYS FROM THE DATE OF DELIVERY. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES OR LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY MAY LAST, OR THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO SUCH LIMITATIONS OR EXCLUSIONS MAY NOT APPLY TO YOU. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS AND YOU MAY ALSO HAVE OTHER RIGHTS, WHICH VARY FROM JURISDICTION TO JURISDICTION.**

## LICENSE

The Company grants the customer a non-exclusive, non-transferable license to use the software, if any, accompanying this product for internal use on a single computer system. The end user may make a single copy of the software solely for backup purposes; otherwise, no copies may be made of the software or any part thereof. No other license of any kind is granted to any part of the product or any of the intellectual property therein.

## **1 INTRODUCTION**

The information contained in this Manual is intended to give in-depth technical assistance to design engineers in the development of system boards utilizing the Trident's CyberBlade i7 Integrated 2D/3D Graphics Core and North Bridge for Socket-7 Notebook PC.

This document includes a technically detailed yet comprehensive reference guide to all aspects of the design specifications and considerations in the development cycle.

This document contains information on the following topics:

- Product Information
- Architectural and functional descriptions
- Electrical Specification
- AC timings
- Configuration (Mode Tables)
- Pin diagrams and descriptions
- Schematic samples
- Register set

### **1.1 Purpose**

This manual is a reference to guide design engineers in applications development. The material provided in this document provides the engineer with information for designing and laying out system boards, configuring the device, detailed pin signal information, and all other technical tasks required for success with the CyberBlade i7.

### **1.2 General Information**

The CyberBlade i7 is an Integrated 2D/3D Graphics Core and North Bridge for Socket-7 Notebook PC. The CyberBlade i7 is a 66/100 MHz Single-Chip Socket-7 / Super-7 North Bridge with PCI System Bus, Integrated AGP 2D / 3D Graphics Accelerator, and Advanced ECC Memory Controller supporting PC100 SDRAM, Virtual Channel SDRAM, EDO, and FPG DRAM.

THIS PAGE INTENTIONALLY LEFT BLANK

## 2 FEATURES

### 2.1 General

- 492 BGA Package (35mm x 35mm )
- 2.5 Volt +/- 0.2V Core
- Supports separately powered 3.3V tolerant interface to CPU and memory.
- Supports separately powered 5.0V tolerant interface to PCI bus and Video interface
- 2.5V, 0.25um, high speed / low power CMOS process
- PC-98/99 compatible
- 66 / 100 MHz Operation

CPU	Internal AGP	DRAM/ VGC	PCI	Comments
100 MHz	66 MHz	100 MHz	33 MHz	Synchronous (DRAM uses CPU clock)
66 MHz	66 MHz	66 MHz	33 MHz	Synchronous (DRAM uses CPU clock)
66 MHz	66 MHz	100 MHz	33 MHz	Up pseudo-synchronous (DRAM uses MEM clock)

## 2.2 Socket 7 Host Interface

- Supports all Socket-7 / Super-7 processors including 64-bit Intel Pentium™ / Pentium™ with MMX™, AMD 6K86™ (K6™ and K6-2™), Cyrix/IBM 6x86™ / 6x86MX™, IDT/Centaur C6, and Rise MP6 CPUs
- 66 / 100 MHz CPU "Front Side Bus"
- Supports 3.3V interface to CPU
- Built-in de-skew PLL (Phase Lock Loop) circuitry for optimal skew control within and between clocking regions
- Cyrix/IBM 6x86™ linear burst support
- AMD K6™ and K6-2™ write allocation support
- Supports CPU-to-DRAM write combining
- System management interrupt, memory remap and stop clock mechanisms

## 2.3 Advanced L2 Cache

- Direct map write-back or write-through secondary cache
- Pipelined burst synchronous SRAM (PBSRAM) cache support
- Flexible cache size: 0K / 256K / 512K / 1M / 2MB
- 32 byte line size to match the primary cache
- Integrated 8-bit tag comparator
- 3-1-1-1-1-1-1 back to back read timing for PBSRAM accesses up to 100 MHz
- Tag timing optimized (less than 4ns setup time) to allow external tag SRAM implementation for most flexible cache organization
- Sustained 3 cycle write access for PBSRAM access or CPU to DRAM & PCI bus post write buffers up to 100 MHz
- Supports CPU single read cycle L2 allocation
- System and video BIOS cacheable and write-protect
- Programmable cacheable region

## 2.4 Internal Accelerated Graphics Port (AGP) Controller

- AGP v2.0 compliant for 1x and 2x transfer modes
- Pipelined split-transaction long-burst transfers up to 533 MB/sec
- Eight level read request queue
- Four level posted-write request queue
- Thirty-two level (quadwords) read data FIFO (128 bytes)

- Sixteen level (quadwords) write data FIFO (64 bytes)
- Intelligent request reordering for maximum AGP bus utilization
- Supports Flush/Fence commands
- Graphics Address Relocation Table (GART)
- One level TLB structure
- Sixteen entry fully associative page table
- LRU replacement scheme
- Independent GART lookup control for host / AGP / PCI master accesses
- Windows 95 OSR-2 VXD and integrated Windows 98 / NT5 miniport driver support

## 2.5 Concurrent PCI Bus Controller

- PCI bus is synchronous / pseudo-synchronous to host CPU bus
- 33 MHz operation on the primary PCI bus
- Supports up to five PCI masters
- Peer concurrency
- Concurrent multiple PCI master transactions; i.e., allow PCI masters from both PCI buses active at the same time
- Zero wait state PCI master and slave burst transfer rate
- PCI to system memory data streaming up to 132Mbyte/sec
- PCI master snoop ahead and snoop filtering
- Six levels (double-words) of CPU to PCI posted write buffers
- Byte merging in the write buffers to reduce the number of PCI cycles and to create further PCI bursting possibilities
- Enhanced PCI command optimization (MRL, MRM, MWI, etc.)
- Forty-eight levels (double-words) of post write buffers from PCI masters to DRAM
- Sixteen levels (double-words) of prefetch buffers from DRAM for access by PCI masters
- Supports L1/L2 write-back forward to PCI master read to minimize PCI read latency
- Supports L1/L2 write-back merged with PCI master post-write to minimize DRAM utilization
- Delay transaction from PCI master reading DRAM
- Read caching for PCI master reading DRAM

- Transaction timer for fair arbitration between PCI masters (granularity of two PCI clocks)
- Symmetric arbitration between Host/PCI bus for optimized system performance
- Complete steerable PCI interrupts
- PCI-2.2 compliant, 32 bit 3.3V PCI interface with 5V tolerant inputs

## 2.6 High-performance DRAM Controller

- 64-bit DRAM interface synchronous with host CPU (66/100 MHz) or internal Memory Clock (100 MHz)
- Concurrent CPU and AGP access
- Supports both standard PC100 and "Virtual Channel" PC100 SDRAMs as well as FPG and EDO DRAMs
- Different DRAM types (FPG, EDO, and SDRAM) may be used in mixed combinations
- Different DRAM timing for each bank
- Dynamic Clock Enable (CKE) control for SDRAM power reduction
- Mixed 1M / 2M / 4M / 8M / 16MxN DRAMs
- 6 banks up to 768MB DRAMs
- Flexible row and column addresses
- 64-bit data width only
- 3.3V DRAM interface
- Programmable I/O drive capability for MA, command, and MD signals
- Optional bank-by-bank ECC (single-bit error correction and multi-bit error detection) or EC (error checking only) for DRAM integrity
- Two-bank interleaving for 16Mbit SDRAM support
- Two-bank and four bank interleaving for 64Mbit SDRAM support
- Supports maximum 8-bank interleave (i.e., 8 pages open simultaneously); banks are allocated based on LRU
- Seamless DRAM command scheduling for maximum DRAM bus utilization (e.g., precharge other banks while accessing the current bank)
- Four cache lines (16 quadwords) of CPU/cache to DRAM write buffers
- Four quadwords of CPU/cache to DRAM read prefetch buffers
- Concurrent DRAM writeback
- Read around write capability for non-stalled CPU read
- Burst read and write operation

- 5-2-2-2-2-2-2 back-to-back accesses for EDO DRAM
- 6-1-1-1-2-1-1-1 back-to-back accesses for SDRAM
- BIOS shadow at 16KB increment
- Decoupled and burst DRAM refresh with staggered RAS timing
- Programmable refresh rate and refresh on populated banks only
- CAS before RAS or self refresh

## 2.7 Sophisticated Power Management Features

- Independent clock stop controls for CPU / SDRAM, Internal AGP and PCI bus
- PCI and AGP bus clock run and clock generator control
- Suspend power plane preserves memory data
- Suspend-to-DRAM and Self-Refresh operation
- Dynamic clock gating for internal functional blocks for power reduction during normal operation
- Low-leakage I/O pads

## 2.8 General Graphic Capabilities

- 64-bit Single Cycle 2D/3D Graphics Engine
- Supports 2 to 8 Mbytes of Frame Buffer located in System Memory
- Real Time DVD MPEG-2 and AC-3 Playback
- Video Processor
- I<sup>2</sup>C Serial Interface
- Integrated 24-bit 230MHz True Color DAC
- Extended Screen Resolutions up to 1600x1200
- Extended Text Modes 80 or 132 columns by 25/30/43/60 rows
- DirectX 6 and OpenGL ICD API

## 2.9 High Performance rCADE3D™ Accelerator

- 32 entry command queue, 32 entry data queue
- 4Kbyte texture cache with over 90% hit rates
- Pipelined Setup/Texturing/Rendering Engines
- DirectDraw™ acceleration
- Multiple buffering and page flipping

#### Setup Engine

- 32-bit IEEE floating point input data
- Slope and vertex calculations
- Back facing triangle culling
- 1/16 sub-pixel positioning

#### Rendering Engine

- High performance single pass execution
- Diffused and specula lighting
- Gouraud and flat shading
- Anti-aliasing including edge, scene, and super-sampling
- OpenGL compliant blending for fog and depth-cueing
- 16-bit Z-buffer
- 8/16/32 bit per pixel color formats

#### Texturing Engine

- D3D compressed texture formats DXT1 and DXT2
- Anisotropic texture filtering
- 1/2/4/8-bits per pixel compact palletized textures
- 16/32-bits per pixel quality non-palletized textures
- Pallet formats in ARGB 565, 1555, or 4444
- Tri-linear, bi-linear, and point-sampled filtering
- Mip-mapping with multiple Level-Of-Detail (LOD) calculations and perspective correction
- Color keying for translucency

#### 2D GUI Engine

- 8/15/16/24/32-bits per pixel color formats
- 256 Raster Operations (ROPs)
- Accelerated drawing: BitBLTs, lines, polygons, fills, patterns, clipping, bit masking
- Panning, scrolling, clipping, color expansion, sprites
- 32x32 and 64x64 Hardware Cursor
- DOS graphics and text modes

### **2.10 DVD**

- Hardware-Assisted MPEG-2 Architecture for DVD with AC-3
- Simultaneous motion compensation and front-end processing (parsing, decryption and decode)
- Supports full DVD 1.0, VCD 2.0 and CD-Karaoke
- Microsoft DirectShow 2.x native support, backward compatible to MCI
- No additional frame buffer requirements

- Dynamic frame and field de-interlace filtering for high quality playback on VGA monitors (Bob and Weave)
- Tamper-proof software CSS implementation
- Freeze, Fast-Forward, Slow Motion, Reverse
- Pan-and-Scan support for 16:9 sequence

### **2.11 Video Processor**

- On-chip Color Space Converter (CSC)
- Anti-tearing via two frame buffer based capture surfaces
- Minifier for video stream compression and filtering
- Horizontal/vertical interpolation with edge recovery
- Dual frame buffer apertures for independent memory access for graphics and video
- YUV 4:2:2/4:1:1/4:2:0 and RGB formats
- Capture / ZV Port to MPEG and video decoder
- Vertical Blank Interval for Intericast™
- Overlay differing video and graphic color depths
- Display two simultaneous video streams from both internal AGP and Capture / ZV Port
- Two scalers and Color Space Converters (CSC) for independent windows

### **2.12 Flat Panel Interface**

- 65MHz DFP interface supports 1024x768 panels
- Frame rate modulation and spatial dithering for increased color depth
- Gamma correction for color enhancement
- Auto expansion and centering
- 16/24-bit interface to DSTNs
- Straight or double pixel/clock interface for up to 1024x768 XGA TFT panels
- Allows external TMDS transmitter for advanced panel interfaces

### **2.13 Testability**

- Build-in NAND-tree pin scan test capability

**CyberBlade™ i7**  
**TECHNICAL REFERENCE MANUAL**

*Rev. 1.0*

### 3 SYSTEM OVERVIEW

The CyberBlade i7 is a PC Socket-7 system logic North Bridge with integrated 2D/3D Graphics accelerator. The core logic portion of the chip is based on the popular 100MHz VIA Apollo MVP3 chipset with enhanced features and graphics accelerator based on the CyberBlade™ 3D from Trident Microsystems, Inc. The combination of the two leading edge technologies provides a stable, cost-effective, and high performance solution for personal computers, embedded systems, set-top boxes and others. As shown in Figure 3-1 below, the CyberBlade i7 will interface to:

- Socket 7 CPU (66 – 100 MHz)
- L2 Cache RAM & Tag
- SDRAM Memory Interface
- PCI Bus (30 - 33 MHz)
- Analog RGB Monitor with DDC
- LVDS/TMDS
- TFT/DSTN Panels
- Video Capture / Playback CODECs

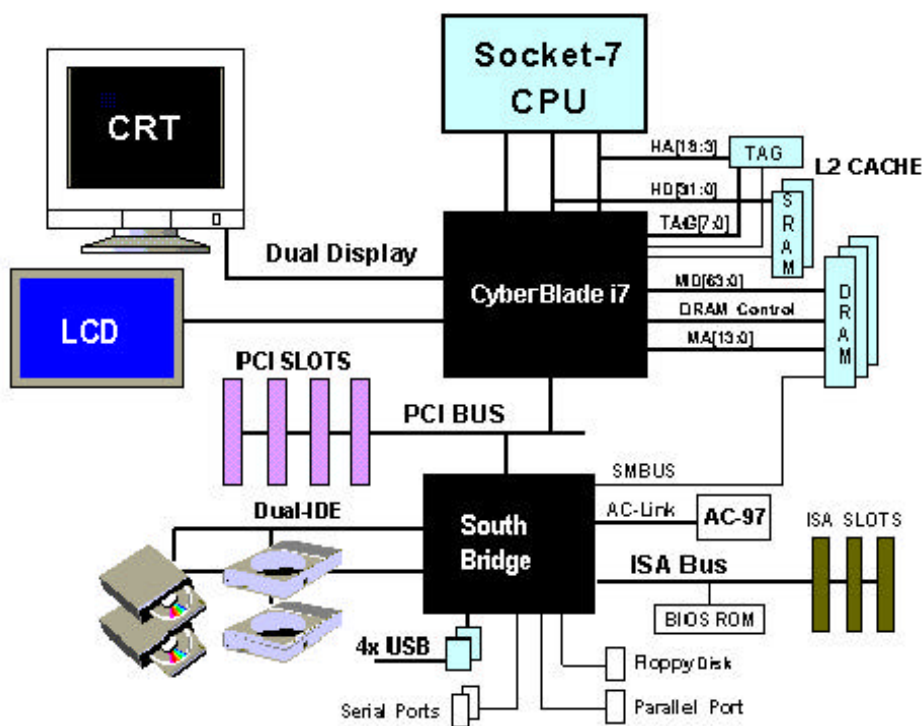

Figure 3-1. CyberBlade i7 High Level System Diagram

### 3.1 CyberBlade i7 Core Logic Overview

The CyberBlade i7 – System Media Accelerated North Bridge (SMA) is a high performance, cost-effective and energy efficient solution for the implementation of Integrated 2D/3D Graphics - PCI - ISA personal computer systems from 66 MHz to 100 MHz based on 64-bit Socket-7 (Intel Pentium and Pentium MMX; AMD K6 and K6-2; Cyrix / National 6x86 / 6x86MX, IDT / Centaur C6/WinChip), and Rise MP6 processors.

The CyberBlade i7 controller provides superior performance between the integrated 2D/3D Graphics Engine, CPU, optional synchronous cache, DRAM, and PCI bus with pipelined, burst, and concurrent operation. For L2-Cache solutions using pipelined burst synchronous SRAMs, 3-1-1-1-1-1-1 timing can be achieved for both read and write transactions at 100 MHz. Tag timing is specially optimized internally (less than 4 nsec setup time) to allow implementation of L2 cache using an external tag for the most flexible cache organization (0K / 256K / 512K / 1M / 2M). Four cache lines (16 quadwords) of CPU/cache to DRAM write buffers with concurrent write-back capability are included on chip to speed up cache read and write miss cycles.

The CyberBlade i7 supports six banks of DRAMs up to 768MB. The DRAM controller supports standard Fast Page Mode (FP) DRAM, EDO-DRAM, Synchronous DRAM (SDRAM), and Virtual Channel Synchronous DRAM in a flexible mix / match manner. The Synchronous DRAM interface allows zero wait state bursting between the DRAM and the data buffers at 100 MHz. The six banks of DRAM can be composed of an arbitrary mixture of 1M / 2M / 4M / 8M / 16MxN DRAMs. The DRAM controller also supports optional ECC (single-bit error correction and multi-bit detection) or EC (error checking) capability separately selectable on a bank-by-bank basis. The DRAM Controller can run at either the host CPU bus frequency (66 / 100 MHz) or at the PC100 memory frequency (100 MHz) with built-in deskew PLL timing control. With the advanced DRAM controller, the CyberBlade i7 allows implementation of the most flexible, reliable, and high-performance DRAM interface.

The CyberBlade i7 also supports full AGP v2.0 capability with the internal 2D/3D Graphics Engine for maximum software compatibility. An eight level request queue plus a four level post-write request queue with thirty-two and sixteen quadwords of read and write data FIFO's respectively are included for deep pipelined and split AGP transactions. A single-level GART TLB with 16 full associative entries and flexible CPU/AGP/PCI remapping control is also provided for operation under protected mode operating environments. Both Windows-95 VXD and Windows-98 / NT5 miniport drivers are supported.

The CyberBlade i7 supports one 32-bit 3.3 / 5V system bus (PCI) that is synchronous / pseudo-synchronous to the CPU bus. The chip also contains a built-in AGP bus -to- PCI bus bridge to allow simultaneous concurrent operations on each bus. Six levels (doublewords) of posted write buffers are included to allow for concurrent CPU and PCI operation. For PCI master operation, forty-eight levels (doublewords) of posted write buffers and sixteen levels (doublewords) of prefetch buffers are included for concurrent PCI bus and DRAM/cache accesses. The chip also supports enhanced PCI bus commands such as Memory-Read-Line, Memory-Read-Multiple, and Memory-Write-Invalid commands to minimize snoop overhead. In addition, advanced features are supported such as snoop ahead, snoop filtering, L1 write-back forward to PCI master, and L1 write-back merged with PCI post write buffers to minimize PCI master read latency and DRAM utilization. Delayed transaction and read caching mechanisms are also implemented for further improvement of overall system performance.

The CyberBlade i7 provides independent clock stop control for the CPU / SDRAM, PCI, and AGP buses and Dynamic CKE control for powering down of the SDRAM. A separate suspend-well plane is implemented for the SDRAM control signals for Suspend-to-DRAM operation.

### 3.2 CyberBlade i7 Graphics Controller Overview

The CyberBlade i7 Graphics Controller is a highly integrated display control device that incorporates a 64-bit 3D/2D graphic engine and video accelerator with advanced DVD video and optional TV output capability. It provides a flexible and high performance solution for graphics and video playback acceleration for various color depth and resolution modes.

The CyberBlade i7 Graphics Controller supports a video capture port to import captured live MPEG 1 or MPEG 2 video streams, or DVD decompressed video streams to be overlaid with a graphics stream of mixed color depth displays. In supporting dual live videos, the CyberBlade i7 Graphics Controller offers independent dual video windows ready for videoconferencing and with linear scaling capability.

Integrating the programmable phase lock loop with high speed LUT DACs, the CyberBlade i7 Graphics Controller is a true price/performance solution for the modern multimedia based entertainment PC.

#### 3.2.1 Capability Overview

The CyberBlade i7 Graphics Controller is a fully integrated LCD/CRT TV capable 64-bit 2D/3D Accelerator. The high performance graphics engine offers high speed 3D image

processing in full compliance and compatibility with IBM® VGA and VESA™ extended VGA. As an integrated controller, it allows unprecedented cost and performance advantages by eliminating the need for an external frame buffer while at the same time gaining local access to a larger amount of memory. Many functions can now be eliminated that previously consumed large amounts of bandwidth.

The CyberBlade i7 Graphics Controller, equipped with a single-cycle 3D GUI Engine, pipelines 3D rendering process architecture in hardware, providing real-time interactions with solid 3D models in CAD/CAM, 3D modeling, and 3D games. It supports all key 3D rendering operations, including: Gouraud shading for smooth object surfaces, texture mapping for realistic object textures, 16-bit hardware Z-buffering for fast 3D depth calculations, and Alpha Blending for transparency effects.

The CyberBlade i7 Graphics Controller's highly innovative design, a full 64-bit memory interface with a high performance graphics engine which can support a RAMDAC™ running up to 230MHz, dramatically improves GUI functions and significantly promotes overall system operation.

The CyberBlade i7 Graphics Controller supports a full AGP implementation internally to remain compatible with existing software and programming models. However, since the engine is integrated it enjoys a higher bandwidth and lower latency than is possible with discrete solutions. AGP operations can include direct access of the system memory by the 2D/3D engine to provide increased texture memory.

To meet the requirements of a PC98/PC99 graphics adapter in a multimedia PC, the CyberBlade i7 Graphics Controller supports planar video format for MPEG-1, MPEG-2, and DVD-video playback. The dual video playback is capable of overlaying windows for videoconferencing and multimedia displays. Advanced features of the CyberBlade i7 Graphics Controller, such as color space conversion, video scaling, dual video windows, dual-view display, video capture / ZV port, Vertical Blanking Interleave (VBI), a 24-bit True Color DAC, and dual clock synthesizers allow performance at peak levels.

By using an extended 16-bit capture / ZV port the CyberBlade i7 Graphics Controller can support DTV resolution. This port can operate as either an input for video capture or as an output for video display

The CyberBlade i7 integrated graphics controller can drive an external TMDS transmitter. This allows an external flat panel monitor to be interfaced through the industry standard DFP interface. Many different panel types can be supported through this standard.

### 3.2.2 System Capabilities

The CyberBlade i7 Graphics Controller's main system features include:

- High Performance single cycle 3D/2D GUI Graphics Engine
- DVD Motion Compensation Hardware
- High speed internal AGP Bus Mastering data bus supporting DVD video playback & 3D
- Highly Integrated RAMDAC™ and Triple Clock Synthesizer
- Dual Video Windows for Videoconferencing
- TrueVideo® Processor
- DirectDraw™ and DirectVideo™ Hardware Support
- Versatile Motion Video Capture/Overlay/Playback Support
- Flexible Frame Buffer Memory Interface
- Advanced Power Management Features
- CRT Power Management (VESA™ DPMS)
- PC98/99 Hardware Support

### 3.2.3 High Performance 64-bit 2D GUI

The 64-bit graphics engine of the CyberBlade i7 Graphics Controller significantly improves graphics performance through specialized hardware that accelerates the most frequently used GUI operations and matches the high-speed requirements of CPUs. Functions directly supported in hardware include: BitBLTs, image and text transfer, line draw, short stroke vector draw, rectangle fills, and clipping. The graphics engine supports 256 Raster Operations (ROPs) for up to 32-bit packed pixel graphic modes. The ROP3 Processor in the CyberBlade i7 Graphics Controller is able to perform Boolean functions which allow many additional operations, including transparency, pattern masking, color expansion alignment, and pattern enhancement. Additionally, the graphics engine features linear display memory addressing (up to 4GB memory space), accelerated color expansion modes for graphics text procession, and memory-mapped I/O registers on the graphics engine for faster access time.

Graphic functions are optimized by a 64-bit internal data bus and a four-color hardware cursor/pop-up icon, operating up to a 128x128x2 pixel image, which offloads the CPU. The hardware cursor mechanism can also be used to display patterns stored in the system memory. This pop-up icon is very useful to display user friendly information instantly through simple hot key operations. This advanced function combination allows significant performance increases over standard Super VGA designs and provides outstanding graphics acceleration on GUIs, such as Microsoft® Windows 95®/98®.

### **3.2.4 Highly Integrated RAMDAC™ & Clock Synthesizer**

The highly integrated design of the CyberBlade i7 Graphics Controller offers a “no TTL” solution for cost-effective, high-performance PC multimedia subsystem designs. The CyberBlade i7 Graphics Controller has a built-in, high speed RAMDAC™. The RAMDAC™ is composed of one 256x24 and one 256x18 color lookup table and a triple loop frequency synthesizer, providing the read/write timing control for the Frame Buffer Memory and the refresh of the TV/CRT display.

The integrated frequency synthesizer provides a 100MHz memory clock for high speed DRAM access and a 230MHz video clock which supports various refresh rates up to 85Hz at 1280x1024.

### **3.2.5 Full Feature High Performance 3D Engine**

The CyberBlade i7 Graphics Controller is equipped with an advanced Graphics Drawing, Single Cycle 3D Graphics Engine that performs premium 3D functions at a high level of more than 2M triangles per second. The 3D engine supports Microsoft® Direct3D. The 3D Engine is set up to off-load the CPU from major 3D tasks including slope calculation, sub-pixel positioning, and Tri-striping. By balancing the 3D pipeline and reducing parameter passing, the CyberBlade i7 Graphics Controller provides very high levels of performance. The 3D engine is integrated with a triangle set-up engine that sets up triangles according to vertex input data and accomplishes various functions for 3D rendering. Gouraud shading provides smooth shading for colors across surfaces, perspective corrected texture mapping to correct texture data based on the perspective, bi-linear texture filtering for interpolating, alpha blending to compensate colors for the opacity of two colors blended, Z-buffering (16-bit/24-bit), video texturing to overlay 2D video play-back onto 3D images, fogging to simulate weather effects, palletized texture mapping (1-, 4-, or 8-bit) for memory and bandwidth reduction, and anti-aliasing to reduce or eliminate jaggies resulted from alias rendering. The 3D engine also works with the APM system, conserving power while 3D operations are suspended.

### **3.2.6 Video Processor**

Video processor features include: on-chip hardware Color Space Conversion (CSC) for faster data conversion on the fly, Horizontal/Vertical (H/V) scaling with interpolation, edge recovery algorithm logic, gamma correction, and overlay control with different color depths from graphics. The CyberBlade i7 Graphics Controller also includes a fully integrated GUI accelerator, read cache, and command FIFO that optimize memory bandwidth and maximize graphics performance.

The CyberBlade i7 Graphics Controller, with an integrated Video Display and a Capture Engine, supports dual apertures on the PCI bus which enables independent graphic and video data to be transported simultaneously to and from different memory areas and greatly accelerates the performance of both DirectDraw™ and DirectVideo™. The CyberBlade i7 Graphics Controller can provide dual video windows that display different images from different video sources (from the PCI bus and from the capture port) on the same screen. The video image is stored in off-screen memory and is retrieved by the Video Display Processing block for video processing. With the help of DirectDraw™ acceleration for sprites, page flipping, double buffering, and color keying, video processing is performed by utilizing a proprietary edge recovery algorithm for sharper line visibility, de-interlacing, anti-tearing, multitap horizontal filtering, dithering, and scaling operations with bilinear interpolation in both horizontal and vertical directions. Linear scaling permits zoom in/out to any size without any restrictions. In addition, the on-chip hardware Color Space Conversion (CSC) accelerates conversion for 16 bit YUV pixels into linear true color 24 bit RGB pixels on the fly. The additional X and Y minifiers are capable of shrinking video images to any linear fractions, which saves bus bandwidth and memory space. The YUV planar logic of the CyberBlade i7 Graphics Controller supports a YUV 420 format that can eliminate redundant video stream decoding procedures. The load of the CPU is reduced while performing software MPEG or software video conferencing. The color and luminance control provided by the CyberBlade i7 Graphics Controller offers color compensations to prevent color distortion for display devices such as a CRT or TV with Gamma correction and hue adjustment control.

The Video Conferencing feature allows remote and local video images to be displayed simultaneously on the same screen.

### **3.2.7 Video Capture and DVD**

The CyberBlade i7 Graphics Controller has a video capture / ZV port and advanced hardware interface logic allowing it to be directly connected to many MPEG and video decoders.

The CyberBlade i7 Graphics Controller, integrated with a DVD video hardware block for motion compensation, gives existing PCs the ability to play DVD video in MPEG-2 format at high bandwidths with very good video quality.

A new industry standard is being set for transmission of non-video data over a TV broadcast signal during vertical blanking dead time. This technology is referred to as InterCast. The CyberBlade i7 Graphics Controller has the ability to take the entire video stream over the video port, sending the visible video stream to the display memory for

display in a window, stripping the VBI data from the stream, and then sending this data to the CPU for processing using PCI Bus Mastering.

### 3.2.8 Versatile Frame Buffer Interface

The CyberBlade i7 Graphics Controller features a versatile frame buffer interface aperture into main system memory. Optimized performance can be achieved with the single cycle memory bus interface using programmable DRAM timing. The display queue has been increased to reduce the frequency of memory bus requests, optimizing memory bus efficiency for the graphic controller.

With the support of the internal AGP aperture, the CyberBlade i7 Graphics Controller has access to system memory through the GART. In the execute mode, the CyberBlade i7 Graphics Controller is able to use both the dedicated graphics portion and the general portion of system memory for graphics operations. As a result, DVD and 3D rendering performance and quality are greatly enhanced.

### 3.2.9 Hi-Res and Hi-Ref Display Support

CyberBlade i7 Graphics Controller display enhancements dramatically improve CRT resolution. These enhancements include support of non-interlaced 1280x1024x64K, 1024x768x16M, 800x600x16M, and 640x480x16M colors for "full spectrum" color. Extended text modes of 80 or 132 columns by 25, 30, 43, or 60 rows provide an extended graphics area frequently used in many spreadsheet and database applications. Extended graphics and text modes are supported by software drivers that provide a "ready-to-go" solution, minimizing the need for additional driver development.

A virtual screen can be created with the CyberBlade i7 Graphics Controller. When this function is enabled, a selected portion of a large image can be shown on a smaller display. The image can also be moved across the whole screen, either up or down.

The CyberBlade i7 Graphics Controller is able to automatically detect DDC monitors with I<sup>2</sup>C signaling.

### 3.2.10 CRT Power Management (VESA DPMS)

The CyberBlade i7 Graphics Controller conforms to the standard power management schemes defined by VESA™ for CRTs. The CyberBlade i7 Graphics Controller supports four states of VESA™ Display Power Management Signaling (DPMS), which decrease monitor power consumption after timeout periods. VESA™ DPMS power down states (ready, standby, suspend, and off) specify HSYNC and VSYNC signals to control the monitor power down state.

### 3.2.11 Flat Panel Interface

The CyberBlade i7 flat panel interface is designed to support industry standard TFT and DSTN panels. The Flat Panel interface can also be used to drive external LVDS or PanelLink™ transmitters.

The high performance VGA Controller provides full hardware level VGA compatibility. At reset, the CyberBlade i7 is in hardware level VGA mode and all of the standard VGA subsections (Display Controller, VGA Graphics Controller, and Attribute Controller) are enabled. The CyberBlade i7 supports LVDS and PanelLink™, providing a low voltage, high speed, low EMI, serial DC-balanced differential data to the LCD panel.

The flat panel interface provides or supports the following functions for various panels:

- Generates flat panel interface signals like FLM, LP, SCLK, and DE
- Generates different video data formats to directly drive different types of panels
- Vertical and horizontal expansion of video displays to LCD panel resolution
- Vertical and horizontal centering
- Panel power sequence

### 3.2.12 Video Capture Interface / ZV Port

A video capture / ZV port is supported for video devices such as MPEG1 and MPEG2. Additionally, a zero-wait state host write buffer, read cache, and memory mapped I/O increase operating speeds and contribute to peak performance levels. All I/O interfaces are 5V tolerant, capable of interfacing with external devices operating at 5V, even though the CyberBlade i7 Graphics Controller runs at 2.5V internally. Graphics system throughput is further enhanced by a command FIFO, allowing maximum bus transfer speed for applications such as Windows™ or AutoCAD™ that directly access video memory.

### 3.2.13 Complete Hardware Compatibility

The CyberBlade i7 Graphics Controller is fully compliant with the VESA™ DDC and VAFC standards. The CyberBlade i7 Graphics Controller is VGA compatible at both the BIOS and Driver level, allowing full compatibility with virtually any VGA application software. The CyberBlade i7 Graphics Controller provides hardware support to DirectDraw™, offering high-speed game graphics on Windows 98®. The CyberBlade i7 Graphics Controller meets the requirements of PC99 as well, supporting a unique ID for each customer and a unique ID for each model.

### **3.3 Advanced Power Management**

The CyberBlade i7 provides flexible and extensive Advanced Power Management (APM) capabilities. Power down modes may be activated by hardware pins, hardware timers, or software control bits. DPMS is provided in either software control mode or hardware timer mode. All APM functions are easily controlled using registers for MCLK, VCLK, Oscillator, LUT/DAC, Panel, Standby, and Suspend. The entire CyberBlade i7 graphics system may be shut down and restored because of the complete read/write capability of all registers.

#### **3.3.1 Power States**

The CyberBlade i7 provides multiple states of power management. The power states, or modes, are defined as ready, standby, suspend, and off ( Table 3-1 and Table 3-2). Through dedicated pins, register programming, and/or activity timers, power states can be set as follows:

##### **Ready Mode**

Ready mode is the state where the CyberBlade i7 is in normal operation. Functional blocks, such as DAC, can be disabled in this mode through register programming to save power.

##### **Standby Mode**

During this mode, the panel power off sequence is activated, the video clock is stopped and the video display is inactive. The CPU can still access I/O registers and the LUT/DAC. The standby state can be entered or exited through register programming and keyboard access. When in simultaneous display mode, the chip activates DPMS off mode with Standby Mode.

##### **Suspend Mode**

This mode is the lowest power consumption state in the CyberBlade i7 before losing main power. During this state, the panel power off sequence will be activated and the video clock will be shut off. The CPU can no longer access the display memory and the LUT/DAC is in power-down mode.

This mode can be activated through a pin or register. When activated by a register, the software will continue to have access to all internal registers. When activated by a pin, the host interface is also powered down. Only the pin can bring it out of the pin-suspend mode. Before the suspend pin can activate the suspend mode, there is a delay of 0 to 15 seconds based on a software-programmed suspend timer register. When deactivated, the suspend pin is not delayed by the suspend timer.

When in simultaneous display mode, the chip will activate DPMS off mode with suspend mode.

##### **Off Mode**

Also known as zero-volt suspend mode or machine powered off mode, this mode allows maximum power savings for long periods. The system can save the complete state of the video subsystem and restore the state later during warm up. The CyberBlade i7 allows all registers to be read and written to support this mode.

#### **3.3.2 Activating and Deactivating Power Modes**

This section describes the major activating and deactivating power modes.

##### **Controlling Standby Mode**

Standby mode is activated by any combination by either register bit or timer settings, depending on which triggering mechanisms are enabled. Deactivating the standby mode is achieved by deactivating all sources that activate standby.

##### **Controlling Suspend Mode**

Suspend mode is activated by of pin or register bit settings, depending on which triggering mechanisms are software enabled. If suspend mode was caused by the pin, a deactivated suspend pin will deactivate suspend mode or the software can disable use of the suspend pin by registers to deactivate suspend mode. If suspend mode was caused by the suspend register bit, only clearing this bit will deactivate suspend mode.

**Table 3-1. Power State Summary**

State	Display	I/O Access	Mem Access	DRAM Refresh	Chip VCC	VCLK	MCLK	DAC
Ready	on	on	on	on	on	on	on	on
Standby	off	on	on	on	on	on	on	off
Software Suspend	off	on	off	on	on	off	off	off
Hardware Suspend	off	off	off	on	on	off	off	off
Off	off	off	off	off	off	off	off	off

**Table 3-2. DPMS State Summary with CRT Only and Hardware Timers**

State	HSYNC	VSYNC	DAC
Ready	on	on	on
Standby	off	on	off
Suspend	on	off	off
Off	off	off	off

### 3.3.3 Power Management Clock Control

If the system "South Bridge" sends a request to the CyberBlade i7 to power down the memory controller, the CyberBlade i7 first uses CLKRUN# (the same signal appearing external to the CyberBlade i7) to check to see if the internal graphics controller needs to access main memory. The graphics controller logic will detect CLKRUN# high for 2 or 3 PCICLK's and check if there are any:

Internal buffers not emptied

PCI Master or AGP Master actions pending

If either condition exists, the graphics controller logic will assert CLKRUN# low for 2 PCICLK's to signal the clock generator to keep PCICLK running.

PME# is not implemented since there are no wake-up conditions.

### 3.3.4 Power Management Registers

Power management control for the CyberBlade i7 Graphics Controller is provided by extended registers SR24 (Power Management Control), GR20 (Standby Timer Control), GR21 (Power Management Control 1), GR22 (Power Management Control 2), GR23 (Power Status), GR24 (Soft Power Control), GR25 (Power Control Select), GR26 (DPMS Control), GR27-28 (GPIO Control), GR2A (Suspend Pin Timer), GR2C (Miscellaneous Pin Control), GR2F (Miscellaneous Internal Control), and Graphics Controller PCI Configuration Indices 90-97 (PCI Power Management Registers 1 and 2).

## 4 ELECTRICAL SPECIFICATIONS

### 4.1 Absolute Maximum Ratings

**Table 4-1. Absolute Maximum Ratings**

Symbol	Parameter	Min	Max	Unit	Notes
T <sub>A</sub>	Ambient operating temperature	0	70	°C	1
T <sub>S</sub>	Storage temperature	-55	125	°C	1
V <sub>IN</sub>	Input voltage	-0.5	V <sub>RAIL</sub> + 10%	Volts	1, 2
V <sub>OUT</sub>	Output voltage	-0.5	V <sub>RAIL</sub> + 10%	Volts	1, 2

Note 1: Stress above the conditions listed may cause permanent damage to the device. Functional operation of this device should be restricted to the conditions described under operating conditions.

Note 2: V<sub>RAIL</sub> is defined as the V<sub>CC</sub> level of the respective rail. The CPU interface can be 3.3V or 2.5V. Memory can be 3.3V only. PCI can be 3.3V or 5.0V. Video can be 3.3V or 5.0V. Flat Panel can be 3.3V or 5.0 V.

### 4.2 DC Characteristics

T<sub>A</sub> = 0-70°C, V<sub>RAIL</sub> = V<sub>CC</sub> +/- 5%, V<sub>CORE</sub> = 2.5V +/- 5%, GND=0V

**Table 4-2. DC Characteristics**

Symbol	Parameter	Min	Max	Unit	Condition
V <sub>IL</sub>	Input Low Voltage	-0.50	0.8	V	
V <sub>IH</sub>	Input High Voltage	2.0	V <sub>CC</sub> +0.5	V	
V <sub>OL</sub>	Output Low Voltage	-	0.55	V	I <sub>OL</sub> =4.0mA
V <sub>OH</sub>	Output High Voltage	2.4	-	V	I <sub>OH</sub> =-1.0mA
I <sub>IL</sub>	Input Leakage Current	-	+/-10	uA	0<V <sub>IN</sub> <V <sub>CC</sub>
I <sub>OZ</sub>	Tristate Leakage Current	-	+/-20	uA	0.55<V <sub>OUT</sub> <V <sub>CC</sub>
I <sub>CC</sub>	Power Supply Current	-	TBD	mA	

**Table 4-3. Recommended Operating Conditions**

Parameter	Min	Max	Unit
5.0V Power	4.75	5.25	Volts
3.3V Power	3.135	3.465	Volts
2.5V Power	2.375	2.625	Volts
Temperature	0	70	°C

Drive strength for selected output pins is programmable. See Rx6D for details.

### 4.3 AC Timing Specifications

**Table 4-4. AC Characteristics – Clock Timing**

Parameter		Min	Max	Unit	Notes
HCLK	Cycle Time	10		ns	
HCLK	High Time	3.0		ns	
HCLK	Low Time	3.0		ns	
HCLK	Rise Time	0.15	1.5	ns	
HCLK	Fall Time	0.15	1.5	ns	
HCLK	Period Stability		+/- 250	ps	1
PCLK	Cycle Time	30		ns	
PCLK	High Time	11		ns	
PCLK	Low Time	11		ns	
PCLK	Rise Time	0.3	1.2	ns	2
PCLK	Fall Time	0.3	1.2	ns	2

Note 1: Jitter frequency power spectrum peaking must occur at frequencies greater than HCLK/3 or less than 500 KHz.

Note 2: Edge rate = 1-4 V/ns

**Table 4-5. AC Characteristics – Reset Timing**

### 4.3.1 Panel Power Sequencing Timing

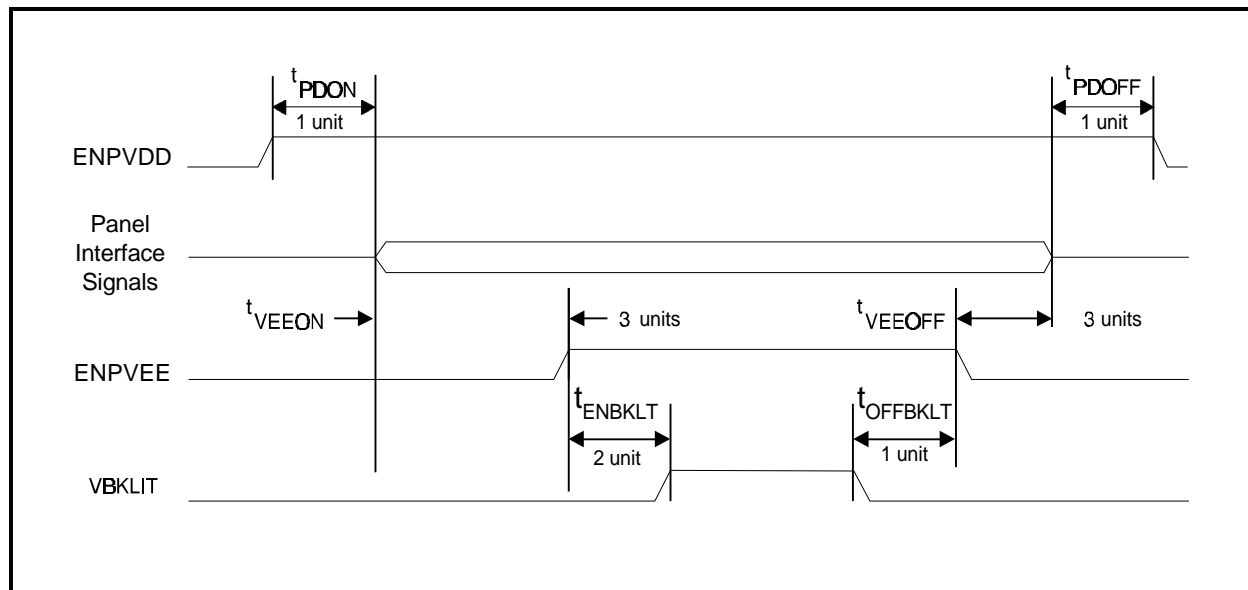

Figure 4-1. Panel Power On/Off Sequence

Table 4-12 Panel Power On/Off Sequence

Symbol	Description	Default	Unit
$t_{PDON}$	ENPVDD active to panel interface signals active	1	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>
$t_{PDOFF}$	Panel interface signals inactive to ENPVDD inactive	1	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>
$t_{VEEON}$	Panel interface signals active to ENPVEE active	3	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>
$t_{VEEOFF}$	ENPVEE inactive to panel interface signals inactive	3	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>
$t_{ENBKLT}$	ENPVEE active to VBKLIT active	2	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>
$t_{OFFBKLT}$	VBKLIT inactive to ENPVEE inactive	1	Frame (one vertical refresh period) or 4ms <sup>1,2</sup>

**Note:**

1. This unit (frame or 4ms) is programmable through 3CF.23.3
2. All signals in this table are programmable to toggle at any one time through 3CF.24[3:0] and 3CF.25[3:0]

#### 4.3.2 Flat Panel Interface Timing

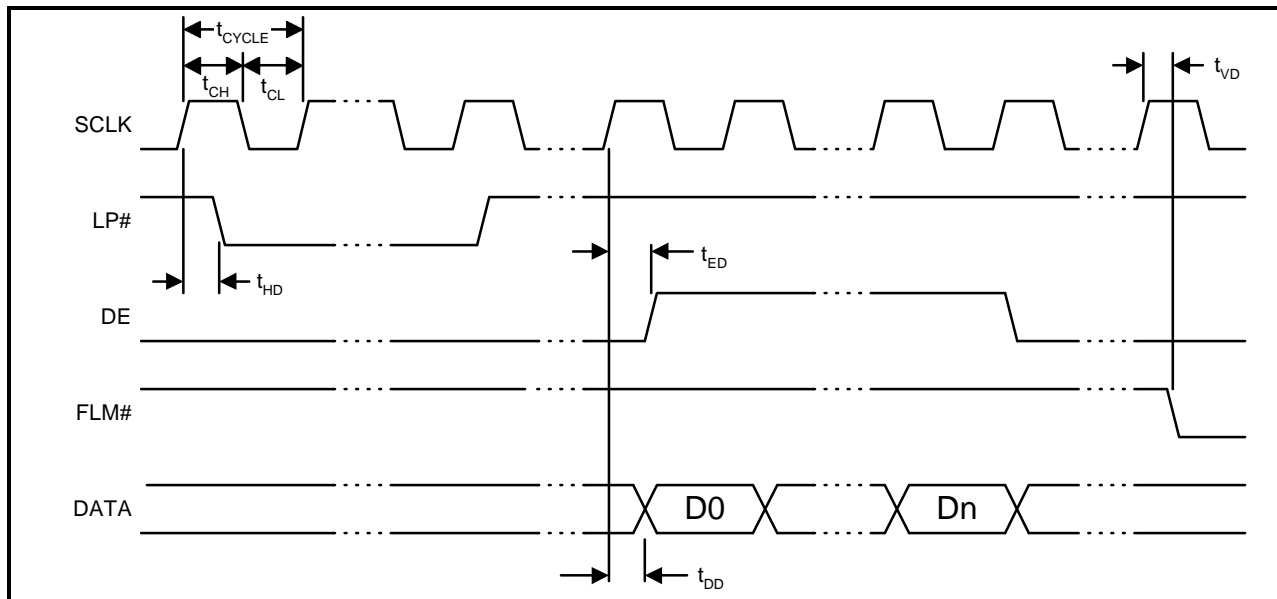

Figure 4-2. Flat Panel Interface Timing

Table 4-13 Flat Panel Interface Timing

Symbol	Min	Max	Description
$t_{CH}/t_{CYCLE}$	40%	55%	Duty cycle
$t_{CL}/t_{CYCLE}$	45%	60%	Duty cycle
$t_{DD}$	-1ns	3ns	Data delay time
$t_{ED}$	-1ns	3ns	Data enable delay time

## 5 Mode Tables

This Chapter defines every possible graphics mode and features supported by the CyberBlade i7. These features include graphics acceleration, MPEG1 and MPEG2 playback, Video capture, and motion compensation for DVD.

### 5.1 BIOS Modes

The video modes listed in this section show supported video BIOS modes. The support for these modes is strictly from the video BIOS. No support from a software driver is needed to display one of these modes. For *Standard VGA Modes*, see Table 5-1. For *Low Resolution modes*, see Table 5-2. For *Extended Modes*, see Table 5-3.

**Table 5-1. Standard VGA Modes**

Mode #	Resolution	Box Size	Pixel Clock (MHz)	Horizontal Frequency (kHz)	Vertical Frequency (Hz)
0,1	320x200	8x8	25.175	31.4	70
2,3	640x200	8x8	25.175	31.4	70
0',1'	320x350	8x14	25.175	31.4	70
2',3'	640x350	8x14	25.175	31.4	70
0+,1+	360x400	9x16	28.322	31.5	70
2+,3+	720x400	9x16	28.322	31.5	70
4,5	320x200	8x8	25.175	31.4	70
6	640x200	8x8	25.175	31.4	70
7	720x350	9x14	28.322	31.5	70
7+	720x400	9x16	28.322	31.5	70
D	320x200	8x8	25.175	31.4	70
E	640x200	8x8	25.175	31.4	70
F	640x350	8x14	25.175	31.4	70
10	640x350	8x14	25.175	31.4	70
11	640x480	8x16	25.175	31.4	60
12	640x480	8x16	25.175	31.4	60
13	320x200	8x8	25.175	31.4	70

**Table 5-2. Low Resolution Modes**

## 5.2 Windows Modes

Table 5-4 through Table 5-17 shows supported Windows modes. Single View and Simultaneous displays are supported in both Windows 98 and Windows 95. Multiple view display is supported in the Windows 98 operating environment through Multi-Head Support (MHS).

### 5.2.1 Single View & Simultaneous Modes

Table 5-4 shows supported hardware features for *Single View* and *Simultaneous* modes. The supported features are *graphics acceleration*, *MPEG1* and *MPEG2* playback, *video capture*, and hardware assist *DVD playback* (motion compensation).

*Simultaneous* modes support the same modes and features as *single view* modes. See Table below.

For *Simultaneous* modes only the combination of LCD and CRT is supported. In addition, the two display devices have the same resolution, color depths, and refresh rate. Since LCD panels have fixed resolutions, panning is necessary when the resolution is larger than the panel resolution.

**Table 5-4. Single View Modes (4MB Video Memory)**

Display Device	CRT					LCD			TV

## 5.2.2 MHS Modes for Windows 98

The Windows™ 98 operating environment provides support for two display devices. The two display devices can be display combinations of LCD and CRT or LCD and TV. Microsoft labels this MHS or Multi-head Support. MHS is very versatile, because the two display devices can have different resolutions, color depths, and refresh rates. There are many combinations.

The Tables listed in this section show supported MHS modes, and which hardware features are supported for each mode.

**Table 5-6. MHS Modes for CRT with SVGA TFT Panel (4MB Video Memory)**

CRT			LCD (800x600 TFT)											
Resolution	Color Depth	Refresh Rate	640x480			800x600			1024x768 <sup>1</sup>			1280x1024 <sup>1</sup>

- NA: Mode not supported

### 5.3 LCD Panel Centering and Expansion

Tables 5-18 and 5-19 show the centering and expansion for LCD panels. As an example if the panel type is 800 x 600 and the vertical resolution of the video mode is 480, the vertical display can be centered or expanded to fill the panel. See Tables below. In the cases where the panel resolution matches the video mode resolution, centering and expansion do not apply, because the display will fill the whole panel.

Note that when applicable all modes can be centered.

**Table 5-18. Panel Vertical Expansion**

Panel Resolution	DISPLAY MODE (VERTICAL LINES)						
	350G	350T	400G	400T	480	600G	768G
LCD 800x600	c, 525*	c, 525*	c,e	c,e	c,e	Match	N/A
LCD 1024x768**	c, 700*	c, 700*	c, 600*	c, 600*	c, 720*	N/A	Match

**Table 5-19. Panel Horizontal Expansion**

Panel Resolution	DISPLAY MODE (HORIZONTAL PIXELS)					
	640,320 G	640,320 T	720	360TG	800	1024
LCD 800x600	c,e	c,e	♦	c,e	Match	N/A
LCD 1024x768**	c, 960*	c, 960*	♦	c, 960*	c, 1000*	Match

**Table codes:** **c** = centered, **e** = expanded to fill panel, **Match** = display resolution matches panel resolution; no centering or expansion is necessary, and **N/A** = not applicable.

**Note:**

\*This number indicates the maximum display resolution after expansion.

\*\*Due to memory bandwidth limitations, all centered modes on 1024x768 150Hz DSTN LCD panels are not supported.

♦Graphics modes that have 720 for the horizontal resolution do not support centering or expansion. As a result, the image will display in the upper left corner of the LCD panel.

## 6.2 Pin Descriptions

Table 6-3. CPU Interface

Signal Name	Pin #	I/O	Signal Description
HD[63:0]	(see pinout tables)	IO	<b>Host CPU Data.</b> These signals are connected to the CPU data bus.
BE[7:0]#	B23, A23, C22, B22, A22, D22, E21, D21	I	<b>Byte Enables.</b> The CPU byte enables indicate which byte lane the current CPU cycle is accessing.
HA[31:3]	(see pinout tables)	IO	<b>Host Address Bus.</b> HA[31:3] connect to the address bus of the host CPU. During CPU cycles HA[31:3] are inputs. These signals are driven by the CyberBlade i7 during cache snooping operations.
ADS#	H23	I	<b>Address Strobe.</b> The CPU asserts ADS# in T1 of the CPU bus cycle to initiate a command
M/IO#	F22	I	<b>Memory / IO Command Indicator</b>
W/R#	J22	I	<b>Write / Read Command Indicator</b>
D/C#	J24	I	<b>Data / Control Command Indicator</b>
BRDY#	G26	O	<b>Bus Ready.</b> The CyberBlade i7 asserts BRDY# to indicate to the CPU that data is available on reads or has been received on writes.
EADS#	J23	O	<b>External Address Strobe.</b> Asserted by the CyberBlade i7 to inquire the L1 cache when serving PCI master accesses to main memory.
KEN# / INV	G22	O	<b>Cache Enable / Invalidate.</b> KEN# / INV functions as both the KEN# signal during CPU read cycles and the INV signal during L1 cache snoop cycles.
HITM#	J25	I	<b>Hit Modified.</b> Asserted by the CPU to indicate that the address presented with the last assertion of EADS# is modified in the L1 cache and needs to be written back.
HLOCK#	H22	I	<b>Host Lock.</b> All CPU cycles sampled with the assertion of HLOCK# and ADS# until the negation of HLOCK# must be atomic.
CACHE#	G23	I	<b>Cacheable Indicator.</b> Asserted by the CPU during a read cycle to indicate the CPU can perform a burst line fill. Asserted by the CPU during a write cycle to indicate that the CPU will perform a burst write-back cycle.
AHOLD	G24	O	<b>Address Hold.</b> The CyberBlade i7 asserts AHOLD when a PCI master is accessing main memory. AHOLD is held for the duration of the PCI burst transfer.
NA#	G25	O	<b>Next Address Indicator.</b>
BOFF#	H25	O	<b>Back Off.</b> Asserted by the CyberBlade i7 when required to terminate a CPU cycle that was in progress.
SMIACK#	H26	I	<b>System Management Interrupt Active.</b> This is asserted by the CPU when it is in system management mode as a result of SMI.

Note: Clocking of the CPU and cache interfaces is performed with HCLK; see the clock pin group at the end of the pin descriptions section for descriptions of the clock input pins.

Note: All signals above require 4.7K pullups to VCC3 except EADS#, HITM#, AHOLD, HA, and HD.

Note: All signals above connect directly to the host CPU except HA and HD which connect directly to the L2 cache SRAMs and connect to the host CPU through 22 ohm series resistors (see schematics in Chapter 7 for more information).

Table 6-4. L2 Cache Control

Signal Name	Pin #	I/O	Signal Description
<b>CADS#</b>	C21	O	<b>Cache Address Strobe.</b> Assertion causes the burst SRAM to load the address register from address pins. Connected to all cache SRAMs.
<b>CADV#</b>	C20	O	<b>Cache Advance.</b> Assertion causes the burst SRAM to advance to the next Quadword in the cache line. Connected to all cache SRAMs.
<b>COE#</b>	B21	O	<b>Cache Output Enable.</b> Typically connected to all cache SRAMs.
<b>CCS#</b>	A21	O	<b>Cache Chip Select.</b> Typically connected to all cache SRAMs.
<b>TA[7:0]</b>	C26, C25, C24, B26, B25, A25, B24, A24	IO	<b>Tag Address.</b> TA0-7 are inputs during CPU accesses and outputs during L2 cache line fills and L2 line invalidates during inquire cycles.
<b>TWE#</b>	C23	O	<b>Tag Write Enable.</b> When asserted, new state and tag addresses are written into the external tag. Connected to all cache SRAMs.
<b>GWE#</b>	B20	O	<b>Global Write Enable.</b> Connected to all cache SRAMs.
<b>BWE#</b>	A20	O	<b>Byte Write Enable.</b> Connected to all cache SRAMs.

Note: CyberBlade i7 pinouts were defined for optimum use with the ATX PCB form factor (shown in simplified form below). The general component layout shown may be used as a guide for ATX PCB component placement.

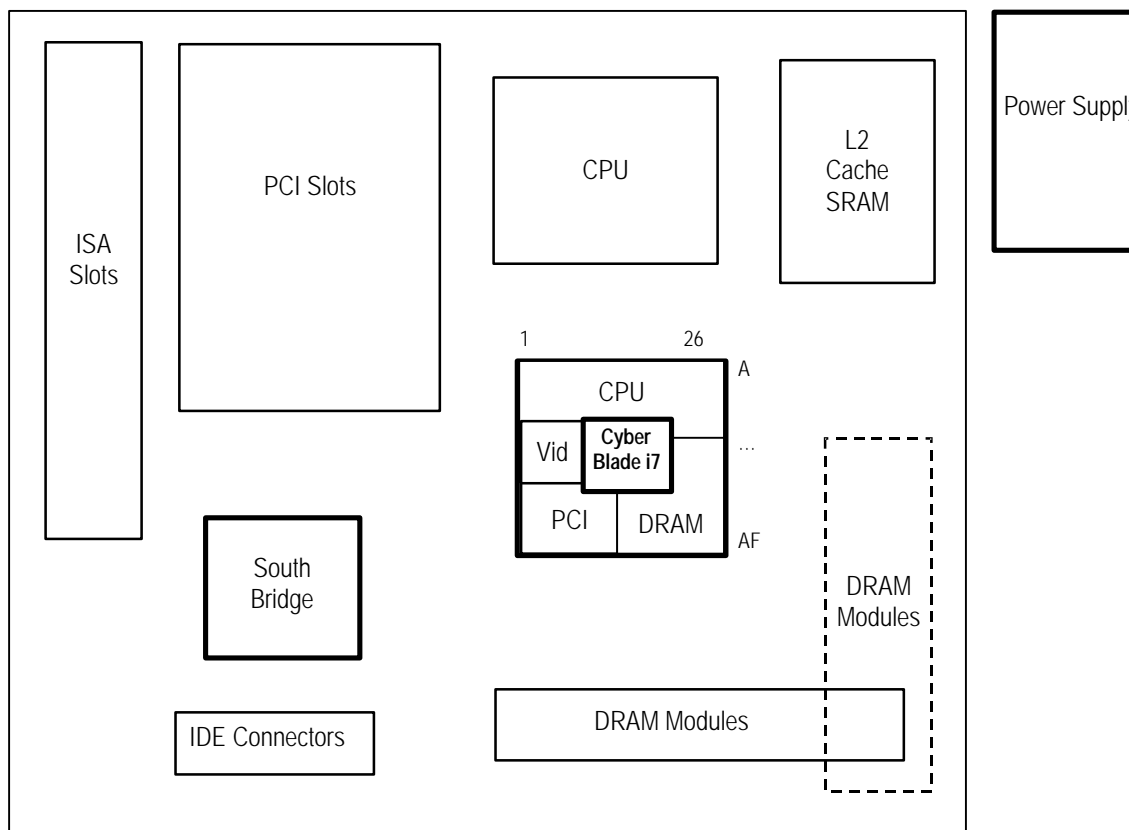

Table 6-5. DRAM Interface

Signal Name	Pin #	I/O	Signal Description
MD[63:0]	(see pinout tables)	IO	<b>Memory Data.</b> These signals are connected to the DRAM data bus. Note: MD0 is internally pulled up for use in EDO memory type detection.
MECC[7-0]	AE22, AF23, V26, V23, AD22, AE23, V24, U23	IO	<b>DRAM ECC or EC Data.</b>  Note: These pins are powered by VSUS
MA[13:0] Power-up Configuration	AF25, AE25, AE26, AD25, AD26, AC24, AC25, AC26, AB23, AB24, AB25, AB26, AA23, AA24	O/I	<b>Memory Address.</b> DRAM address lines. These pins are also used for power-up configuration options (sampled on the rising edge of RESET#): MA13-12 Rx68 [1-0] Host CPU Bus Frequency (0=Auto, 1=100, 2=66) MA11 SERR Pin Function (0=SERR, 1=PWRGD) MA10-9 North Bridge Clock Delay (0-3 Clocks) MA8 -reserved- MA7 Graphics Test Mode (0 =Normal, 1 = Test Mode) MA6 LCD Output (0 = Off, 1 = On) MA5-3 Panel Type (0-3 = TFT, 4-7 = DSTN) MA2 -reserved- MA1-0 Graphics Clock Delay (0-3 Clocks) All pins have internal pull-downs for default low (0). Strap 1 using 4.7KΩ.
RAS5# / CS5# / CKE1#, RAS4# / CS4# / CKE0#, RAS3# / CS3#, RAS2# / CS2#, RAS1# / CS1#, RAS0# / CS0#	AA25, AA26, Y23, Y24, Y25, Y26	O	<b>Multifunction Pins</b> 1. FPG/EDO DRAM: Row Address Strobe of each bank. 2. Synchronous DRAM: Chip select of each bank. 3. Clock Enable: Clock enables 1-0 (see SCASC# & SRASC# for CKE[3-2]#). CKE[3-0]# may be connected to the DRAM modules in any order. Each DRAM module requires 2 clock enables, so CKE[3-0]# may only be used to implement Suspend to RAM with the first 2 modules. Note: These pins are powered by VSUS.
CAS#[7:0] / DQM#[7:0]	AD23, AE24, W26, V22, AF24, AD24, W25, V25	O	<b>Multifunction Pins</b> 1. FPG/EDO DRAM: Column Address Strobe of each byte lane. 2. Synchronous DRAM: Data mask of each byte lane. Note: These pins are powered by VSUS.
SRASA#, SRASB#, SRASC# / CKE3#	U25, U26, U22	O	<b>Row Address Command Indicator.</b> For support of up to three Synchronous DRAM DIMM slots (these are not copies as each DIMM slot may have separate timing). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). See RAS[5-4]# for an explanation of CKE3#.
SCASA#, SCASB#, SCASC# / CKE2#	T26, T22, U24	O	<b>Column Address Command Indicator.</b> For support of up to three Synchronous DRAM DIMM slots (these are not copies as each DIMM slot may have separate timing). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). See RAS[5-4]# for an explanation of CKE2#.
SWEA# / MWEA#, SWEB# / MWEB#, SWEC# / MWECS#	W23, W22, Y22	O	<b>Write Enable Command Indicator.</b> For support of up to three Synchronous DRAM DIMM slots (these are not copies as each DIMM slot may have separate timing). Multifunction pins, used as MWE# pins for FPG/EDO memory. "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). Note: These pins are powered by VSUS.

Note: Clocking of the memory subsystem uses memory clock (MCLK); see the clock pin group at the end of the pin descriptions section for descriptions of the clock pins.

Note: Connect all memory interface pins except MD and MECC to the DRAM modules through 22Ω series resistors (see schematics in Chapter 7 for more information).

Table 6-6. PCI Bus Interface

Signal Name	Pin #	I/O	Signal Description
AD[31:0]	(see pinout tables)	IO	<b>Address/Data Bus.</b> The standard PCI address and data lines. The address is driven with FRAME# assertion and data is driven or received in following cycles.
CBE[3:0]#	AC5, AD7, AD9, AB10	IO	<b>Command/Byte Enables.</b> Commands are driven with FRAME# assertion. Byte enables corresponding to supplied or requested data are driven on following clocks.
PAR	AC8	IO	<b>Parity.</b> A single parity bit is provided over AD[31:0] and C/BE[3:0].
FRAME#	AF7	IO	<b>Frame.</b> Assertion indicates the address phase of a PCI transfer. Negation indicates that one more data transfer is desired by the cycle initiator. 10K $\Omega$ pullup to VCC3.
IRDY#	AE7	IO	<b>Initiator Ready.</b> Asserted when initiator is ready for data transfer. 10K $\Omega$ pullup to VCC3.
TRDY#	AB7	IO	<b>Target Ready.</b> Asserted when target is ready for data transfer. 10K $\Omega$ pullup to VCC3.
STOP#	AE8	IO	<b>Stop.</b> Asserted by the target to request the master to stop the current transaction. 10K $\Omega$ pullup to VCC3.
DEVSEL#	AC7	IO	<b>Device Select.</b> This signal is driven by the CyberBlade i7 when a PCI initiator is attempting to access main memory. It is an input when the CyberBlade i7 is acting as a PCI initiator. 10K $\Omega$ pullup to VCC3.
LOCK#	AF8	IO	<b>Lock.</b> Used to establish, maintain, and release resource lock. 10K $\Omega$ pullup to VCC3.
SERR# / PWRGD	AB8	IO / I	<b>System Error.</b> The CyberBlade i7 will pulse this signal when it detects a system error condition (10K $\Omega$ pullup to VCC3). May optionally be configured as a PWRGD input (see strapping pin MA11).
PREQ#	AF12	I	<b>South Bridge Request.</b> This signal comes from the South Bridge. PREQ# is the South Bridge request for the PCI bus. 10K $\Omega$ pullup to VCC3.
PGNT#	AC12	O	<b>South Bridge Grant.</b> This signal driven by the CyberBlade i7 to grant PCI access to the South Bridge. 10K $\Omega$ pullup to VCC3.
REQ[3:0]#	AC1, AC3, AD2, AE1	I	<b>PCI Master Request.</b> PCI master requests for use of the PCI bus. 2.2K $\Omega$ pullup to VCC5.
GNT[3:0]#	AB5, AC2, AD1, AD3	O	<b>PCI Master Grant.</b> Permission is given to the master to use the PCI bus. 2.2K $\Omega$ pullup to VCC3.
REQX#	AB4	I	<b>High Priority PCI Master Request.</b> CyberBlade special high priority master request for use of the PCI bus. 4.7K $\Omega$ pullup to VCC3 if not used.
GNTX#	AB3	O	<b>High Priority PCI Master Grant.</b> Permission is given to the CyberBlade high priority master to use the PCI bus.
INTA#	Y5	O	<b>PCI Interrupt Out.</b> INTA# is an asynchronous active low output used to signal an event that requires handling. It is driven by the integrated graphics controller.

Note: Clocking of the PCI interface is performed with PCLK; see the clock pin group at the end of the pin descriptions section for descriptions of the clock input pins.

Table 6-7. Clock / Reset Control

Signal Name	Pin #	I/O	Signal Description
HCLK	AC21	I	<b>Host Clock.</b> This pin receives the host CPU clock. This clock is used by all logic in the host CPU domain. It is driven by the external clock synthesizer.
MCLKI	AF22	I	<b>Memory Clock In.</b> This clock is used by internal clock logic to maintain the proper phase relationship with MCLKO. It is driven by the external clock synthesizer.
MCLKO	AB21	O	<b>Memory Clock Out.</b> Created on-chip from MCLKI and used by the memory controller as a timing reference for creation of all memory timing sequences. It is connected to the external clock chip for use in maintaining proper phase relationships.
PCLK	AB12	I	<b>PCI Clock.</b> This clock is used by all on-chip logic in the PCI clock domain. This input must be 33 MHz maximum to comply with PCI specification requirements and must be synchronous with the host CPU clock (HCLK) with an HCLK:PCLK frequency ratio of 2:1 (66MHz CPU clock) or 3:1 (100 MHz CPU clock). The PCI clock needs to be controlled to within $1.5 \pm 0.5$ nsec relative to the host CPU clock (CPU leads).
PCKRUN#	AC13	IO	<b>PCI Clock Run.</b> For implementation of PCI bus clock control for low-power PCI bus operation. Refer to the "PCI Mobile Design Guidelines" for additional information.
XLTI	AA4	I	<b>Crystal Input.</b> 14.31818 MHz for the video clock synthesizer reference. Connect to a 14.31818 MHz clock source if a crystal not used. Connect to main ground plane GND with 10pF if using a crystal.
XLTO	AA5	O	<b>Crystal Output.</b> 14.31818 MHz for the video clock synthesizer reference. Leave open if a clock source is used instead of a crystal. Connect to main ground plane GND with 10pF if using a crystal.
RESET#	AF13	I	<b>Reset.</b> Driven from the South Bridge RESET signal through an inverter. When asserted (low), this signal resets the CyberBlade i7 and sets all register bits to the default value. This signal also connects to the PCI bus (South Bridge RESET drives the ISA bus if implemented). The rising edge of this signal is used to sample all power-up strap options (see memory interface MA pins).
PWROK	AE13	I	<b>Power OK.</b> Connect to South Bridge and Power Good circuitry.
SUST#	AC22	I	<b>Suspend Status.</b> For implementation of the Suspend-to-DRAM feature. <u>Input logic for this pin is powered by VSUS.</u> Connect to the South Bridge SUST# pin or to a 10K $\Omega$ pullup to VSUS if not used.
SUSP#	F5	I	<b>Suspend.</b> For implementation of the Suspend-to-DRAM feature. <u>Input logic for this pin is powered by VSUS.</u> Connect to South Bridge GPO pin or to a 10K $\Omega$ pullup to VSUS if not used.

Table 6-8. Miscellaneous

Signal Name	Pin #	I/O	Signal Description
ENTST#	F4	I	<b>Test Mode Enable.</b> 4.7K $\Omega$ pullup to VCC3 for normal operation.
IMIO	N2	O	<b>IMI Out.</b> Leave open.
IMIIN	N4	I	<b>IMI In.</b> 4.7K $\Omega$ pullup to VCC3.

Table 6-9. CRT Interface

Signal Name	Pin #	I/O	Signal Description
RED	C2	A	<b>Red.</b> Red analog output to the CRT. Connect 75 $\Omega$ load resistor to GNDR (RGB Return) and connect to VGA connector through a series ferrite bead and 10pF capacitors to GNDR on both input and output sides of the bead (see schematics in chapter 7).
GRN	D3	A	<b>Green.</b> Green analog output to the CRT. Connect same as RED.
BLUE	D2	A	<b>Blue.</b> Blue analog output to the CRT. Connect same as RED.
HSYNC	E2	O	<b>Horizontal Sync.</b> Digital horizontal sync output to the CRT. Also used (with VSYNC) to signal power management state information to the CRT per the VESA™ DPMS™ standard. Connect to VGA connector through a series 47 $\Omega$ resistor and 120pF capacitor to ground (see schematics in chapter 7).
VSYNC	E1	O	<b>Vertical Sync.</b> Digital vertical sync output to the CRT. Also used (with HSYNC) to signal power management state information to the CRT per the VESA™ DPMS™ standard. Connect to VGA connector through a series 47 $\Omega$ resistor and 120pF capacitor to ground (see schematics in chapter 7).
SDA	F2	IO	<b>DDC Data/Address.</b> Serial I <sup>2</sup> C protocol for VESA™ DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7K $\Omega$ pullup. Connect to the VGA connector only (pin 12 of the connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the schematics in chapter 7.
SCL	F3	IO	<b>DDC Clock.</b> Serial I <sup>2</sup> C protocol for VESA™ DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7K $\Omega$ pullup. Connect to the VGA connector only (pin 15 of the VGA connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the schematics in chapter 7.

Table 6-10. Panel Interface

<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
PD[23-0]	(see pin list)	O	<b>Panel Data.</b> Digital monitor pixel data outputs.
SHFCLK	H5	O	<b>Shift Clock.</b> Clock for transferring digital pixel data.
DE	H4	O	<b>Data Enable.</b> Indicates valid data on PD[23-0].
LP	G4	O	<b>Line Pulse.</b> Digital monitor equivalent of HSYNC.
FLM	G5	O	<b>First Line Marker.</b> Digital monitor equivalent of VSYNC.
ENPVDD	F1	O	<b>Enable Panel VDD Power.</b>
ENPVEE	G1	O	<b>Enable Panel VEE Power.</b>
ENPBLT	G3	O	<b>Enable Panel Backlight.</b>
IMIO	N2	O	<b>IMI Output.</b>
IMIIN	N4	I	<b>IMI Input.</b>

Note: Connect SHFCLK, DE, LP, and FLM to external TMDS transmitters through series 22 $\Omega$  resistors. See schematics in Chapter 7 for DFP interface design examples and additional information.

**Table 6-11. TV Input / Video Interface**

<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
<b>VIDD[15-0]</b>	(see pin list)	IO	<b>Video Capture / Playback Data.</b> Connect to TV decoder if used.
<b>VIDHS</b>	U4	IO	<b>Video Horizontal Sync.</b> Connect to TV decoder if used.
<b>VIDVS</b>	U3	IO	<b>Video Vertical Sync.</b> Connect to TV decoder if used.
<b>VIDCLK</b>	V3	IO	<b>Video Clock.</b> Connect to TV decoder through a series 22 $\Omega$ resistor.

Note: Refer to the schematics in Chapter 7 for video interface design examples.

**Table 6-12. TV Output Interface**

<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
<b>TVD[7-0]</b>	V2, U5, V1, V5, V4, W5, W2, W1	O	<b>TV Output Data.</b> Connect to TV encoder if used.
<b>TVHS</b>	W4	O	<b>TV Horizontal Sync.</b> Connect to TV encoder if used.
<b>TVVS</b>	Y3	O	<b>TV Vertical Sync.</b> Connect to TV encoder if used.
<b>TVCLK</b>	Y4	O	<b>TV Clock.</b> Connect to TV encoder through a series 22 $\Omega$ resistor.

Note: Refer to the schematics in Chapter 7 for TV interface design examples.

**Table 6-13. Digital Power and Ground**

Signal Name	Pin #	I/O	Signal Description
VCC5	U6	P	<b>Power for Display / Video Interfaces</b> (5V $\pm$ 5%). Power for CRT H/VSYNC, DFP interface, video interface, and TV interface. Used to provide adequate output voltage swing for driving external video devices. Also used to provide 5V input tolerance from those interfaces.
VCC3	C8, C19, F7, F8, F19, F20, G6, G21, H3, H6, H21, H24, L12, L15, M11, M16, R11, R16, T12, T15, W3, W6, W21, W24, Y6, Y21, AA7, AA8, AA19, AA20, AD8, AD19	P	<b>Power for On-Board Interfaces</b> (2.5V to 3.3V $\pm$ 5%). Power for host CPU / L2 Cache interface, PCI bus interface, and memory interface (except pins listed below under VSUS).
VSUS3	U21, AB19	P	<b>Suspend Power</b> (3.3V $\pm$ 5%). Power for memory interface signals SRASC#, SCASC#, SWEC#, SWEB#, RAS[5-0]#, CAS[7-0]#, and MECC[7-0] as well as SUSTAT# and SUSCLK. Connect to VCC3 if suspend functions are not implemented.
VSUS2	AA22	P	<b>Suspend Power</b> (2.5V $\pm$ 5%). Connect to VCCI if suspend functions are not implemented.
VCCI	F9, F18, J6, J21, V6, V21, AA9, AA18	P	<b>Power for On-Chip Internal Logic</b> (2.5V $\pm$ 5%).
VCCD	Y1	P	<b>Power for Video Clock Synthesizer Digital Logic</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see schematics in chapter 7).
VCCR	D1	P	<b>Power for RAMDAC Video Output Digital Logic</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see schematics in chapter 7).
GND	A13, A26, C14, D4, D23, E13, E14, F6, F21, L11, L13, L14, L16, M12-M15, N3, N5, N11-N16, N22, N26, P1, P5, P11-P16, P22, R12-R15, T11, T13, T14, T16, AA6, AA21, AB13, AB14, AC4, AC23, AD13, AF14, AF26	P	<b>Ground.</b> Connect to primary PCB ground plane.

Commonly Used Prefix / Suffix Letters in Signal Names:

I = Internal Logic

M = Memory (SDRAM) Interface

H = Host CPU Interface

P = PCI Bus Interface

G = AGP Bus Interface (internal in CyberBlade i7)

U (or USB) = USB (Universal Serial Bus)

H (or HWM) = Hardware Monitoring

SUS = Suspend Power

A = North Bridge Clock Synthesizer

V1 = Video Clock Synthesizer PLL1

V2 = Video Clock Synthesizer PLL2

D = Video Clocks Digital Data Path

R = RAMDAC Digital Data Path

S = RAMDAC Current Source

RGB = Analog Video Out Return

TV = TV Out

VID = TV In

**Table 6-14. Clock Power / Ground and Filtering**

<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
VCCA	AB16, AC16	P	<b>Power for North Bridge Clock Circuitry</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to GNDA with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see schematics in chapter 7).
GNDA	AA17, AB17	P	<b>Ground for North Bridge Clock Circuitry.</b> Connect to main ground plane GND through a ferrite bead. (see schematics in chapter 7).
VCCV1	Y2	P	<b>Power for Video Clock Synthesizer 1 Analog Circuitry</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to GNDV1 with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see schematics in chapter 7).
GNDV1	AA1	P	<b>Ground for Video Clock Synthesizer 1.</b> Connect to main ground plane through a ferrite bead.
VLF1	AA3	A	<b>Low Pass Filter Capacitor for Video Clock Synthesizer 1.</b> Connect to GNDV1 through a 560pF capacitor.
VCCV2	AA2	P	<b>Power for Video Clock Synthesizer 2 Analog Circuitry</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to GNDV2 with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (schematics in chapter 7).
GNDV2	AB1	P	<b>Ground for Video Clock Synthesizer 2.</b> Connect to main ground plane through a ferrite bead.
VLF2	AB2	A	<b>Low Pass Filter Capacitor for Video Clock Synthesizer 2.</b> Connect to GNDV2 through a 560pF capacitor.

**Table 6-15. RAMDAC Output Power / Ground and Analog Control**

<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
VCCS	C1	P	<b>Power for RAMDAC Current Source Circuitry</b> (2.5V $\pm$ 5%). Connect to VCCI through a ferrite bead and decouple to GNDS with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see schematics in chapter 7).
GNDS	B1	P	<b>Ground for RAMDAC Current Source Circuitry.</b> Connect to main ground plane through a ferrite bead.
COMP	E4	A	<b>Compensation Capacitor.</b> RAMDAC analog control. Connect to VCCS using a 0.1 uF capacitor.
IRSET	E3	A	<b>RAMDAC Current Set Point Resistor.</b> RAMDAC analog control. Connect to GNDS through a 360 $\Omega$ 1% resistor.
GNDRGB	A1	P	<b>RGB Video Output Return.</b> Connection point for the RGB load resistors. Also used as a shield for the RGB video output traces to the VGA display connector. Connects to RGB return pins 6, 7, and 8 of the VGA connector. Connect to main ground plane through a ferrite bead.

### 6.3 Panel Signal Mapping

**Table 6-16. DSTN Pins PD[0:23]**

Type	PD0	PD1	PD2	PD3	PD4	PD5	PD6	PD7	PD8	PD9	PD10	PD11	PD12	PD13	PD14	PD15
<b>DSTN16</b>	LD0	LD1	LD2	LD3	LD4	LD5	LD6	LD7	UD0	UD1	UD2	UD3	UD4	UD5	UD6	UD7
<b>DSTN24</b>	LD0	LD1	LD2	LD3	LD4	LD5	LD6	LD7	LD8	LD9	LD10	LD11	UD0	UD1	UD2	UD3
	<b>PD16</b>	<b>PD17</b>	<b>PD18</b>	<b>PD19</b>	<b>PD20</b>	<b>PD21</b>	<b>PD22</b>	<b>PD23</b>								
<b>DSTN24</b>	UD4	UD5	UD6	UD7	UD8	UD9	UD10	UD11								

**Notes:** 1. For 16-bit color dual scan DSTNs, LD7 or UD7 above corresponds to red column 0 for the first data of a line.  
2. For 24-bit color dual scan DSTNs, LD11 or UD11 above corresponds to red column 0 for the first data of a line. UD4-UD11 are on P16-P23.

<b>18+18</b>	R5	R4	R3	R2	G5	G4	G3	G2	B5	B4	B3	B2	R1	R0	G1	G0	B1	B0					S1	S2
<b>24</b>	R7	R6	R5	R4	G7	G6	G5	G4	B7	B6	B5	B4	R3	R2	G3	G2	B3	B2	R1	R0	G1	G0	B1	B0

**Table 6-18. Panel Type Abbreviation Key**

Abbreviation	Description
DSTN16	Color STN dual scan panel, 16-bit data interface
DSTN24	Color STN dual scan panel, 24-bit data interface
TFTxx	TFT panel, xx bit color data or xx/3-bit mono data interface

THIS PAGE INTENTIONALLY LEFT BLANK

## 7 SYSTEM DESIGN

### 7.1 Power-up Configuration

During power-on and system reset, configuration information is latched on the rising edge of the system RESET signal. This information is latched into the CyberBlade's internal configuration registers, and it is based on the status of the signals on MA0 to MA13. Note that all these pins have an internal pull-down resistor that defaults to a logic low. If a logic high is required, the signal must be strapped high using a 4.7K $\Omega$  resistor.

DRAM Address Lines	Descriptions		
MA[13:12]	Rx68	[1-0]	Host CPU Bus Frequency (0=Auto, 1=100, 2=66)
MA[11]	SERR Pin Function (0=SERR, 1=PWRGD)		
MA[10:9]	North Bridge Clock Delay (0-3 Clocks)		
MA[8]	-reserved-		
MA[7]	Graphics Test Mode (0 =Normal, 1 = Test Mode)		
MA[6]	LCD Output (0 = Off, 1 = On)		
MA[5:3]	Panel Type (0-3 = TFT, 4-7 = DSTN)		
	<b>LCD Type</b>	<b>LCD Resolution</b>	<b>MA[5-3]</b>
	TFT	1024 x 768 x 18-bit	000
	TFT	1280 x 1024 x 18+18-bit	001
	TFT	800 x 600 x 18-bit	010
	TFT	1024 x 600 x 18-bit	011
	DSTN	1024 x 768 x 16-bit	100
	DSTN	1024 x 600 x 24-bit	101
	DSTN	800 x 600 x 16-bit	110
	DSTN	1024 x 768 x 24-bit	111
MA[2]	-reserved-		
MA[1:0]	Graphics Clock Delay (0-3 Clocks)		

## 7.2 Hardware interfaces

TO ENABLE SUSPEND TO DRAM  
REMOVE R991- R994 AND  
ADD R995- R998

Figure 1 is a block diagram of the JFET input stage. It shows five input channels, labeled MB2 through MB5, each connected to a common output line labeled VCC3. Each channel consists of a resistor (R273 to R276) connected to a common input line, followed by a JFET (JFPT1 to JFPT3) and a load resistor (10K). The gates of the JFETs are connected to a common gate line, which is also connected to VCC3. The sources of the JFETs are connected to a common source line, which is also connected to VCC3. The drains of the JFETs are connected to the common output line. The diagram is labeled 'VCC3' at the top right and 'VCC3' at the bottom right.

7-18

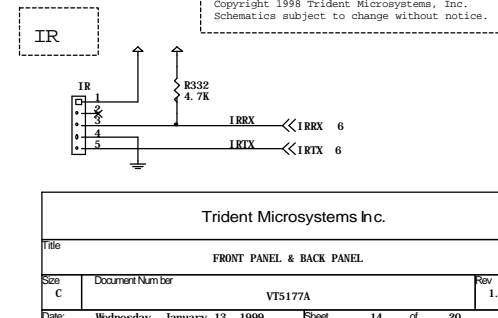

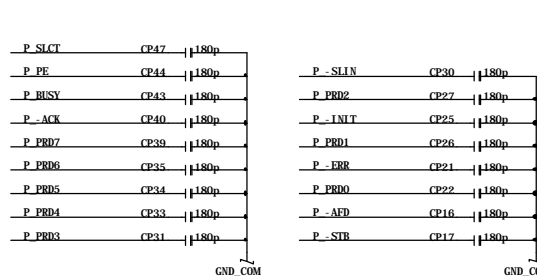

The PCB layout for the PS2 module includes the following components and connections:

- PS2 Connector:** A 6-pin connector with pins 1 through 6. Pins 1, 2, and 3 are connected to the PS2 module pins. Pins 4, 5, and 6 are connected to the PS2 module pins.
- Power and Ground:**
  - VCC PS2:** Connected to the PS2 module pin 1.
  - GND PS:** Connected to the PS2 module pin 2.
  - PS2 FUSE:** A fuse connected between VCC PS2 and the PS2 module pin 1.
  - CB13:** A 0.1uF capacitor connected between VCC PS2 and GND PS.
  - PS2\_STACKED\_CONN:** A connector connected to the PS2 module pin 3.
- Signal Traces:**
  - KB\_DATA:** A signal trace connected to the PS2 module pin 4.
  - KB\_CLK:** A signal trace connected to the PS2 module pin 5.
  - MS\_DATA:** A signal trace connected to the PS2 module pin 6.
  - MS\_CLK:** A signal trace connected to the PS2 module pin 7.
- Other Components:**
  - CP11, CP12, CP13, CP14:** 47pF capacitors connected to the signal traces.
  - RN1:** A 4.7K resistor connected to the PS2 module pin 1.
  - PS3:** A component connected to the PS2 module pin 1.

## 8 REGISTERS

### 8.1 Register Overview

The following tables summarize the configuration and I/O registers of the CyberBlade i7. These tables also document the power-on default value ("Default") and access type ("Acc") for each register. Access type definitions used are RW (Read/Write), RO (Read/Only), "—" for reserved / used (essentially the same as RO), and RWC (or just WC) (Read / Write 1's to Clear individual bits). Registers indicated as RW may have some read/only bits that always read back a fixed value (usually 0 if unused); registers designated as RWC or WC may have some read-only or read write bits (see individual register descriptions following these tables for details). All offset and default values are shown in hexadecimal unless otherwise indicated.

### 8.2 Register Summary

#### 8.2.1 I/O Ports

Port #	I/O Port	Default	Acc
22	PCI / AGP Arbiter Disable	00	RW
CFB-8	Configuration Address	0000 0000	RW
CFF-C	Configuration Data	0000 0000	RW

#### 8.2.2 Device 0 Registers - Host Bridge

#### Header Registers

Offset	Configuration Space Header	Default	Acc
1-0	Vendor ID	1106	RO
3-2	Device ID	0501	RO
5-4	Command	0006	RW
7-6	Status	0290	WC
8	Revision ID	nn	RO
9	Program Interface	00	RO
A	Sub Class Code	00	RO
B	Base Class Code	06	RO
C	-reserved- (cache line size)	00	—
D	Latency Timer	00	RW
E	Header Type	00	RO
F	Built In Self Test (BIST)	00	RO
13-10	Graphics Aperture Base	0000 0008	RW
14-27	-reserved- (base address registers)	00	—
28-2F	-reserved- (unassigned)	00	—
33-30	-reserved- (expan ROM base addr)	00	—
37-34	Capability Pointer	0000 00A0	RO
34-3B	-reserved- (unassigned)	00	—
3C-3D	-reserved- (interrupt line & pin)	00	—
3E-3F	-reserved- (min gnt and max latency)	00	—

### Device-Specific Registers

Offset	Cache Control	Default	Acc
50	Cache Control 1	00	RW
51	Cache Control 2	00	RW
52	Non-Cacheable Control	00	RW

### 8.3 Miscellaneous I/O

One I/O port is defined in the CyberBlade i7: Port 22.

#### Port 22 – PCI Arbiter Disable..... RW

7-2	Reserved .....	always reads 0
1	PCI #2 (AGP) Arbiter Disable	
	0 Respond to GREQ# signal.....	default
	1 Do not respond to GREQ# signal	
0	PCI #1 Arbiter Disable	
	0 Respond to all REQ# signals.....	default
	1 Do not respond to any REQ# signals, including PREQ#	

This port can be enabled for read/write access by setting bit-7 of Device 0 Configuration Register 78.

### 8.4 Configuration Space I/O

All registers in the CyberBlade i7 (listed above) are addressed via the following configuration mechanism:

#### Mechanism #1

These ports respond only to double-word accesses. Byte or word accesses will be passed on unchanged.

#### Port CFB-CF8 - Configuration Address..... RW

31	Configuration Space Enable	
	0 Disabled.....	default
	1 Convert configuration data port writes to configuration cycles on the PCI bus	
30-24	Reserved .....	always reads 0
23-16	PCI Bus Number	
	Used to choose a specific PCI bus in the system	
15-11	Device Number	
	Used to choose a specific device in the system (devices 0 and 1 are defined)	
10-8	Function Number	
	Used to choose a specific function if the selected device supports multiple functions (only function 0 is defined).	
7-2	Register Number (also called the "Offset")	
	Used to select a specific DWORD in the configuration space	
1-0	Fixed .....	always reads 0

#### Port CFF-CFC - Configuration Data..... RW

Refer to PCI Bus Specification Version 2.1 for further details on operation of the above configuration registers.

## 8.5 Register Descriptions

### 8.5.1 Device 0 Header Registers - Host Bridge

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number, function number, and device number equal to zero.

#### Device 0 Offset 1-0 - Vendor ID ..... RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

#### Device 0 Offset 3-2 - Device ID ..... RO

15-0 ID Code (reads 0501h to identify the CyberBlade i7)

#### Device 0 Offset 5-4 - Command ..... RW

- 15-10 Reserved ..... always reads 0
- 9 **Fast Back-to-Back Cycle Enable** ..... RO
  - 0 Fast back-to-back transactions only allowed to the same agent ..... default
  - 1 Fast back-to-back transactions allowed to different agents
- 8 **SERR# Enable** ..... RO
  - 0 SERR# driver disabled ..... default
  - 1 SERR# driver enabled
 (SERR# is used to report parity errors if bit-6 is set).
- 7 **Address / Data Stepping** ..... RO
  - 0 Device never does stepping ..... default
  - 1 Device always does stepping
- 6 **Parity Error Response** ..... RW
  - 0 Ignore parity errors & continue ..... default
  - 1 Take normal action on detected parity errors
- 5 **VGA Palette Snoop** ..... RO
  - 0 Treat palette accesses normally ..... default
  - 1 Don't respond to palette accesses on PCI bus
- 4 **Memory Write and Invalidate Command** ..... RO
  - 0 Bus masters must use Mem Write ..... default
  - 1 Bus masters may generate Mem Write & Inval
- 3 **Special Cycle Monitoring** ..... RO
  - 0 Does not monitor special cycles ..... default
  - 1 Monitors special cycles
- 2 **Bus Master** ..... RO
  - 0 Never behaves as a bus master
  - 1 Can behave as a bus master ..... default
- 1 **Memory Space** ..... RO
  - 0 Does not respond to memory space
  - 1 Responds to memory space ..... default
- 0 **I/O Space** ..... RO
  - 0 Does not respond to I/O space ..... default
  - 1 Responds to I/O space

#### Device 0 Offset 7-6 - Status ..... RWC

- 15 **Detected Parity Error**
  - 0 No parity error detected ..... default
  - 1 Error detected in either address or data phase. This bit is set even if error response is disabled (command register bit-6) ..... write one to clear
- 14 **Signaled System Error (SERR# Asserted)** ..... always reads 0
- 13 **Signaled Master Abort**
  - 0 No abort received ..... default
  - 1 Transaction aborted by the master ..... write one to clear
- 12 **Received Target Abort**
  - 0 No abort received ..... default
  - 1 Transaction aborted by the target ..... write 1 to clear
- 11 **Signaled Target Abort** ..... always reads 0
  - 0 Target Abort never signaled
- 10-9 **DEVSEL# Timing**
  - 00 Fast
  - 01 Medium always reads 01
  - 10 Slow
  - 11 Reserved
- 8 **Data Parity Error Detected**
  - 0 No data parity error detected ..... default
  - 1 Error detected in data phase. Set only if error response enabled via command bit-6 = 1 and CyberBlade i7 was initiator of the operation in which the error occurred. .... write one to clear
- 7 **Fast Back-to-Back Capable** ..... always reads 1
- 6 **Reserved** ..... always reads 0
- 5 **66MHz Capable** ..... always reads 0
- 4 **Supports New Capability list** ..... always reads 1
- 3-0 **Reserved** ..... always reads 0

#### Device 0 Offset 8 - Revision ID ..... RO

7-0 CyberBlade i7 Chip Revision Code

#### Device 0 Offset 9 - Programming Interface ..... RO

7-0 Interface Identifier ..... always reads 00

#### Device 0 Offset A - Sub Class Code ..... RO

7-0 Sub Class Code . reads 00 to indicate Host Bridge

#### Device 0 Offset B - Base Class Code ..... RO

7-0 Base Class Code reads 06 to indicate Bridge Device

#### Device 0 Offset D - Latency Timer ..... RW

Specifies the latency timer value in PCI bus clocks.

7-3 **Guaranteed Time Slice for CPU** ..... default=0

2-0 **Reserved** (fixed granularity of 8 clks) always read 0  
 Bits 2-1 are writeable but read 0 for PCI specification compatibility. The programmed value may be read back in Offset 75 bits 5-4 (PCI Arbitration 1).

**Device 0 Host Bridge Header Registers (continued)**

**Device 0 Offset E - Header Type ..... RO**

7-0 Header Type Code.....reads 00: single function

**Device 0 Offset F - Built In Self Test (BIST) ..... RO**

7 BIST Supported...reads 0: no supported functions

6-0 Reserved .....always reads 0

**Device 0 Offset 13-10 - Graphics Aperture Base ..... RW**

31-28 Upper Programmable Base Address Bits..def=0

27-20 Lower Programmable Base Address Bits..def=0

These bits behave as if hardwired to 0 if the corresponding Graphics Aperture Size register bit (Device 1 Offset 84h) is 0.

27	26	25	24	23	22	21	20	(This
Register)								
7	6	5	4	3	2	1	0	(Gr Aper
Size)								
RW	RW	RW	RW	RW	RW	RW	RW	1M

RW	RW	RW	0	0	0	0	0	32M
RW	RW	0	0	0	0	0	0	64M
RW	0	0	0	0	0	0	0	128M
0	0	0	0	0	0	0	0	256M

19-0 Reserved .....always reads 00008

Note: The locations in the address range defined by this register are prefetchable.

**Device 0 Offset 37-34 - Capability Pointer..... RO**

Contains an offset from the start of configuration space.

31-0 AGP Capability List Pointer .....always reads A0h

## 8.5.2 Device 0 Configuration Registers - Host Bridge

### Cache Control

#### Device 0 Offset 50 - Cache Control 1 ..... RW

- 7-6 **Cache Enable / Initialize**
  - 00 Cache disable..... default
  - 01 Cache Initialize - always does L2 fill
  - 10 Cache enable (normal operation)
  - 11 Reserved (do not use)
- 5 **Linear Burst**
  - 0 Disable default
  - 1 Enable
- 4-3 **Tag Configuration**
  - 00 8+0 - 8 Tag bits, no alt (dirty) bit..... default
  - 01 7+1 - 7 Tag bits + alternate (dirty) bit
  - 1x Reserved
- 2-0 **Reserved** ..... always read 0

#### Device 0 Offset 51 - Cache Control 2 ..... RW

- 7-6 **Reserved (no function)** ..... RW
- 5 **Backoff CPU**

Set to one to backoff CPU when non-streaming access to fill L2 cache. Used when register 52h bit-2 is set for "L2 fill when CACHE# is inactive". This bit should normally be set to 0 for best performance, but performance differences are typically not significantly noticeable at the system level.

  - 0 Defer ready return until L2 is filled ..... default
  - 1 Backoff CPU until L2 is filled
- 4 **Fast AHOLD generation** ..... always reads 0
  - 0 Disable default
  - 1 Enable
- 3 **SRAM Banks** ..... (default set from inverse of MA)
  - 0 1 Bank
  - 1 2 Banks
- 2 **Reserved** ..... always reads 0
- 1-0 **Cache Size** .. (bit-0 default set from inverse of MA)
  - 00 256K
  - 01 512K
  - 10 1M
  - 11 2M

#### Device 0 Offset 52 - Non-Cacheable Control..... RW

- 7 **C0000-C7FFF Cacheable & Write-Protect**.. def=0
- 6 **D0000-DFFFF Cacheable & Write-Protect**.. def=0
- 5 **E0000-EFFFF Cacheable & Write-Protect**.. def=0
- 4 **F0000-FFFFF Cacheable & Write-Protect**.. def=0
- 3 **2T DRAM Write Request**
  - 0 Disable default
  - 1 Enable (RX53[2] must be enabled if this bit is enabled, If this bit is set, RX53[7] must be disabled) should be disable with this bit enable)
- 2 **L2 Fill on Single Read**
  - 0 Normal L2 cache fill.....default
  - 1 Force the requested data to be filled into the L2 cache (provided that L2 cache is enabled), even if the CPU does a read cycle with CACHE# de-asserted. Setting this bit significantly improves performance.
- 1 **AMD K6-3 2T Write Pipe Support**
  - 0 Disable default
  - 1 Enable
- 0 **L2 Write Thru/Write-Back**
  - 0 Write-Back .....default
  - 1 Write-Thru

#### Device 0 Offset 53 - System Performance Control ... RW

- 7 **Read Around Write**
  - 0 Disable.....default
  - 1 Enable
- 6 **Cache Read Pipeline Cycle**
  - 0 Disable.....default
  - 1 Enable
- 5 **Cache Write Pipeline Cycle**
  - 0 Disable default
  - 1 Enable
- 4 **DRAM Read Pipeline Cycle**
  - 0 Disable.....default
  - 1 Enable
- 3 **Reduce Cache-to-DRAM Latency while PCI Master Active**
  - 0 Disable default
  - 1 Enable
- 2 **3T DRAM Write Request**
  - 0 Disable default
  - 1 Enable
- 1 **CPU to DRAM Write Combining**
  - 0 Disable default
  - 1 Enable
- 0 **Peer Concurrency**
  - 0 Disable default
  - 1 Enable

110 2M (Base Address A16-20 must be 0)  
111 4M (Base Address A16-21 must be 0)

## 8.6 DRAM Control

These registers are normally set at system initialization time and not accessed after that during normal system operation. Some of these registers, however, may need to be programmed using specific sequences during power-up initialization to properly detect the type and size of installed memory

**Table 8-1. System Memory Map**

Space	Start	Size	Address Range	Comment

10	Read enable
11	Read/write enable
3-2	<b>Memory Hole</b>
00	None ..... default
01	512K-640K
10	15M-16M (1M)
11	14M-16M (2M)
1-0	<b>SMI Mapping Control</b>
00	Disable SMI Address Redirection ..... default
01	Allow access to DRAM Axxxx-Bxxxx for both normal and SMI cycles
10	Reserved
11	Allow SMI Axxxx-Bxxxx DRAM access

Note: The A0000-BFFFF address range is reserved for use by VGA controllers for system access to the VGA frame buffer. Since frame buffer accesses are normally directed to the system VGA controller (with its separate memory subsystem), system DRAM locations in the A0000-BFFFF range would normally be unused. Setting the above bits appropriately allows this block of system memory to be used by directing Axxxx-Bxxxx accesses to corresponding memory addresses in system DRAM instead of directing those accesses to the PCI bus for VGA frame buffer access.

## Device 0 Offset 6E - ECC Control..... RW

7	ECC / ECMode Select	
	0	ECC Checking and Reporting .....default
	1	ECC Checking, Reporting, and <u>Correcting</u>
6	Reserved	.....always reads 0
5	Enable SERR# on ECC / EC Multi-Bit Error	
	0	Don't assert SERR# for multi-bit errors..... def
	1	Assert SERR# for multi-bit errors
4	Enable SERR# on ECC / EC Single-Bit Error	
	0	Don't assert SERR# for single-bit errors..... def
	1	Assert SERR# for single-bit errors
3	Reserved	.....always reads 0
2	ECC / EC Enable - Bank 5/4 (DIMM 2)	
	0	Disable (no ECC or EC for banks 5/4) ...default
	1	Enable (ECC or EC per bit-7)
1	ECC / EC Enable - Bank 3/2 (DIMM 1)	
	0	Disable (no ECC or EC for banks 3/2) ...default
	1	Enable (ECC or EC per bit-7)
0	ECC / EC Enable - Bank 1/0 (DIMM 0)	
	0	Disable (no ECC or EC for banks 1/0) ...default
	1	Enable (ECC or EC per bit-7)

Error checking / correction may be enabled bank-pair by bank-pair (DIMM by DIMM) by using bits 0-2 above. Bank pairs must be populated with 72-bit memory to enable for EC or ECC since the additional data bits must be present in either case. For this reason, if 64-bit memory is populated in a particular bank pair, the corresponding bit 0-2 should be set to 0 to disable both EC and ECC for that bank pair. For those bank pairs that have 72-bit memory available (and have the corresponding bit 0-2 set), either EC or ECC may be selected via bit-7 above (i.e., all enabled bank pairs will use EC or all will use ECC).

If error checking / reporting only (EC) is selected, all read and write cycles will use normal timing. Partial writes (with EC or ECC enabled) will use read-modify-write cycles to maintain correct error correction codes in the additional 8 data bits. If EC and ECC are disabled for a particular bank pair, partial writes to that bank pair will use the byte enables to write only the selected bytes (using normal write cycles and cycle timing). If error correction (ECC) is selected, the first read of a transaction will always have one additional cycle of latency.

Bit-7	Bits 2-0	RMW	Error Checking	Error
<u>Correction</u>				
0/1	0	No	No	No
0	1	Yes	Yes	No
1	1	Yes	Yes	Yes

**Device 0 Offset 6F - ECC Status.....RWC**

- 7      **Multi-bit Error Detected**.....write of '1' resets  
6-4    **Multi-bit Error DRAM Bank** ..... default=0  
      Encoded value of the bank with the multi-bit error.
- 3      **Single-bit Error Detected** .....write of '1' resets  
2-0    **Single-bit Error DRAM Bank** ..... default=0  
      Encoded value of the bank with the single-bit error.

## 8.7 PCI Bus #1 Control

These registers are normally programmed once at system initialization time.

### Device 0 Offset 70 - PCI Buffer Control..... RW

7	<b>CPU to PCI Post-Write</b>
0	Disable..... default
1	Enable
6	<b>PCI Master to DRAM Post-Write</b>
0	Disable..... default
1	Enable
5	<b>Reserved</b>
4	<b>PCI Master to DRAM Prefetch Disable</b>
0	Enable..... default
1	Disable
3	<b>Reserved (do not program)..... default = 0</b>
2	<b>PCI Master Read Caching</b>
0	Disable..... default
1	Enable
1	<b>Delay Transaction</b>
0	Disable..... default
1	Enable
0	<b>Reduce One PCI Idle Cycle when Cycle is Retried by Slave</b>
0	Disable..... default
1	Enable

### Device 0 Offset 71 - CPU to PCI Flow Control 1..... RW

7	<b>Dynamic Burst</b>
0	Disable.....default
1	Enable (see note under bit-3 below)
6	<b>Byte Merge</b>
0	Disable.....default
1	Enable
5	<b>Reserved (do not program)..... default = 0</b>
4	<b>PCI I/O Cycle Post Write</b>
0	Disable.....default
1	Enable
3	<b>PCI Burst</b>
0	Disable.....default
1	Enable (bit7=1 will override this option)
bit-7	bit-3
0	0
	<b>Operation</b>
0	1
	Every write goes into the write buffer and no PCI burst operations occur.
0	1
	If the write transaction is a burst transaction, the information goes into the write buffer and burst transfers are later performed on the PCI bus. If the transaction is not a burst, PCI write occurs immediately (after a write buffer flush).
1	x
	Every write transaction goes to the write buffer; burstable transactions will then burst on the PCI bus and non-burstable won't. This is the normal setting.
2	<b>PCI Fast Back-to-Back Write</b>
0	Disable.....default
1	Enable
1	<b>Quick Frame Generation</b>
0	Disable.....default
1	Enable
0	<b>1 Wait State PCI Cycles</b>
0	Disable.....default
1	Enable

**Device 0 Offset 72 - CPU to PCI Flow Control 2.....RWC**

7	<b>Retry Status</b>
0	Retry occurred less than retry limit ..... default
1	Retry occurred more than x times (where x is defined by bits 5-4) ..... <b>write 1 to clear</b>
6	<b>Retry Timeout Action</b>
0	Retry Forever (record status only) ..... default
1	Flush buffer for write or return all 1s for read
5-4	<b>Retry Limit</b>
00	Retry 2 times ..... default
01	Retry 16 times
10	Retry 4 times
11	Retry 64 times
3	<b>Clear Failed Data and Continue Retry</b>
0	Flush the entire post-write buffer ..... default
1	When data is posting and master (or target) abort fails, pop the failed data if any, and keep posting
2	<b>CPU Backoff on PCI Read Retry Failure</b>
0	Disable ..... default
1	Backoff CPU when reading data from PCI and retry fails
1	<b>Reduce 1T for FRAME# Generation</b>
0	Disable ..... default
1	Enable
0	<b>Reserved</b> (do not program) ..... default = 0

**Device 0 Offset 73 - PCI Master Control 1..... RW**

7	<b>Reserved</b> ..... always reads 0
6	<b>PCI Master 1-Wait-State Write</b>
0	Zero wait state TRDY# response ..... default
1	One wait state TRDY# response
5	<b>PCI Master 1-Wait-State Read</b>
0	Zero wait state TRDY# response ..... default
1	One wait state TRDY# response
4	<b>Disable Prefetch when Doing Delay Transaction</b>
0	Enable ..... default
1	Disable
3	<b>Assert STOP# after PCI Master Write Timeout</b>
0	Disable ..... default
1	Enable
2	<b>Assert STOP# after PCI Master Read Timeout</b>
0	Disable ..... default
1	Enable
1	<b>LOCK# Function</b>
0	Disable ..... default
1	Enable
0	<b>PCI Master Broken Timer Enable</b>
0	Disable ..... default
1	Enable. Force into arbitration when there is no FRAME# 16 PCICLK's after the grant. Does not apply to south bridge PREQ# input

**Device 0 Offset 74 - PCI Master Control 2..... RW**

7	<b>PCI Master Read Prefetch by Enhance Command</b>
0	Always Prefetch ..... default
1	Prefetch only if Enhance command
6	<b>PCI Master Write Merge</b>
0	Disable default
1	Enable
5	<b>Reserved</b> ..... always reads 0
4	<b>Dummy Request Handling.....</b> Should be set to 1
0	As VP3 ..... default
1	Complete Fix
3	<b>PCI#1 Delay Transaction Time-Out</b>
0	Disable ..... default
1	Enable
2	<b>Backoff CPU Immediately on CPU to PCI#2 Retry</b>
0	Disable ..... default
1	Enable
1-0	<b>CPU/PCI Master Latency Timer Control</b>
00	PCI#2 Master Reloads MLT timer ..... default
01	Falling edge of PCI#2 Master Request reloads MLT timer
10	Rising Edge of PCI#2 Master Request clears MLT timer and falling edge reloads the timer
11	Reserved (illegal setting)

**Device 0 Offset 75 - PCI Arbitration 1..... RW**

- 7 Arbitration Mechanism**
  - 0 PCI has priority..... default
  - 1 Fair arbitration between PCI and CPU
- 6 Arbitration Mode**
  - 0 REQ-based (arbitrate at end of REQ#) . default
  - 1 Frame-based (arbitrate at FRAME# assertion)
- 5-4 Latency Timer** ..... read only, reads Rx0D bits 2:1
- 3-0 PCI Master Bus Time-Out**  
(force into arbitration after a period of time)
  - 0000 Disable..... default
  - 0001 1x32 PCLKs
  - 0010 2x32 PCLKs
  - 0011 3x32 PCLKs
  - 0100 4x32 PCLKs
  - ... ..
  - 1111 15x32 PCLKs

**Device 0 Offset 76 - PCI Arbitration 2..... RW**

- 7 PCI #2 Master Access PCI #1 Retry Disconnect**
  - 0 Disable (PCI #2 will not be disconnected until access finishes).....default
  - 1 Enable (PCI #2 will be disconnected if max retries are attempted without success)
- 6 CPU Latency Timer Bit-0..... RO**
  - 0 CPU has at least 1 PCLK time slot when CPU has PCI bus
  - 1 CPU has no time slot
- 5-4 Master Priority Rotation Control**
  - 00 Disabled (arbitration per Rx75 bit-7) .....default
  - 01 Grant to CPU after every PCI master grant
  - 10 Grant to CPU after every 2 PCI master grants
  - 11 Grant to CPU after every 3 PCI master grants

With setting 01, the CPU will always be granted access after the current bus master completes, no matter how many PCI masters are requesting. With setting 10, if other PCI masters are requesting during the current PCI master grant, the highest priority master will get the bus after the current master completes, but the CPU will be guaranteed to get the bus after that master completes. With setting 11, if other PCI masters are requesting, the highest priority will get the bus next, then the next highest priority will get the bus, then the CPU will get the bus. In other words, with the above settings, even if multiple PCI masters are continuously requesting the bus, the CPU is guaranteed to get access after every master grant (01), after every other master grant (10) or after every third master grant (11).
- 3-2 High Priority REQ Select**
  - 00 REQ4 .....default
  - 01 REQ0
  - 10 REQ1
  - 11 REQ2
- 1 C2P QW High DW Read Access to PCI Slave Allow Backoff**
  - 0 Disable.....default
  - 1 Enable
- 0 High Priority Request Support**
  - 0 Disable.....default
  - 1 Enable

**Device 0 Offset 77 - Chip Test Mode..... RW**

- 7-6 Reserved (no function)** ..... always reads 0
- 5-0 Reserved (do not use)** .....default=0

**Device 0 Offset 78 - PMU Control 1 ..... RW**

- 7 **I/O Port 22 Access**
  - 0 CPU access to I/O address 22h is passed on to the PCI bus ..... default
  - 1 CPU access to I/O address 22h is processed internally
- 6 **Suspend Refresh Type**
  - 0 CBR Refresh ..... default
  - 1 Self Refresh
- 5 **Reserved** .....always reads 0
- 4 **Dynamic Clock Control**
  - 0 Normal (clock is always running) ..... default
  - 1 Clock to various internal functional blocks is disabled when those blocks are not being used
- 3 **Reserved** .....always reads 0
- 2 **AGPSTP# control**
  - 0 Disable ..... default
  - 1 Enable
- 1 **Reserved** .....always reads 0
- 0 **Memory Clock Enable (CKE) Function**
  - 0 CKE Disable (pins used as MECC[2-0]) .....def
  - 1 CKE Enable (pins used for CKE[2-0])#

**Device 0 Offset 7E – DLL Test Mode..... RW**

- 7-6 **Reserved (status)**.....RO
- 5-0 **Reserved (do not use)** .....default=0

**Device 0 Offset 7F – DLL Test Mode..... RW**

- 7-0 **Reserved (do not use)** .....default=0

**Device 0 Offset 79 – PMU Control 2 ..... RW**

- 7 **CPU Interface Controller Dynamic Clock Stopping**
  - 0 Disable ..... default
  - 1 Enable
- 6 **DRAM Controller Dynamic Clock Stopping**
  - 0 Disable ..... default
  - 1 Enable
- 5 **AGP Controller Dynamic Clock Stopping**

  - 01 100 usec
  - 10 1 msec
  - 11 1 sec

## 8.8 GART / Graphics Aperture Control

The function of the Graphics Address Relocation Table (GART) is to translate virtual 32-bit addresses issued by an AGP device into 4K-page based physical addresses for system memory access. In this translation, the upper 20 bits (A31-A12) are remapped, while the lower 12 address bits (A11-A0) are used unchanged.

A one-level fully associative lookup scheme is used to implement the address translation. In this scheme, the upper 20 bits of the virtual address are used to point to an entry in a page table located in system memory. Each page table entry contains the upper 20 bits of a physical address (a "physical page" address). For simplicity, each page table entry is 4 bytes. The total size of the page table depends on the GART range (called the "aperture size") which is programmable in the CyberBlade i7.

This scheme is shown in the figure below.

**Figure 8-1. Graphics Aperture Address Translation**

Since address translation using the above scheme requires an access to system memory, an on-chip cache (called a "Translation Lookaside Buffer" or TLB) is utilized to enhance performance. The TLB in the CyberBlade i7 contains 16 entries. Address "misses" in the TLB require an access of system memory to retrieve translation data. Entries in the TLB are replaced using an LRU (Least Recently Used) algorithm.

Addresses are translated only for accesses within the "Graphics Aperture" (GA). The Graphics Aperture can be any power of two in size from 1MB to 256MB (i.e., 1MB, 2MB, 4MB, 8MB, etc). The base of the Graphics Aperture can be anywhere in the system virtual address space on an address boundary determined by the aperture size (e.g., if the aperture size is 4MB, the base must be on a 4MB address boundary). The Graphics Aperture Base is defined in register offset 10 of device 0. The Graphics Aperture Size and TLB Table Base are defined in the following register group (offsets 84 and 88 respectively) along with various control bits.

**Device 0 Offset 83-80 - GART/TLB Control ..... RW**

31-16	Reserved .....always reads 0
15-8	Reserved (test mode status)..... RO
7	<b>Flush Page TLB</b>
	0 Disable..... default
	1 Enable
6-4	Reserved (always program to 0) ..... RW
3	<b>PCI#1 Master Address Translation for GA Access</b>
	0 Addresses generated by PCI #1 Master accesses of the Graphics Aperture <u>will not</u> be translated ..... default
	1 PCI #1 Master GA addresses <u>will</u> be translated
2	<b>PCI#2 Master Address Translation for GA Access</b>
	0 Addresses generated by PCI #2 Master accesses of the Graphics Aperture <u>will not</u> be translated ..... default
	1 PCI #2 Master GA addresses <u>will</u> be translated
1	<b>CPU Address Translation for GA Access</b>
	0 Addresses generated by CPU accesses of the Graphics Aperture <u>will not</u> be translated .....def
	1 CPU GA addresses <u>will</u> be translated
0	<b>AGP Address Translation for GA Access</b>
	0 Addresses generated by AGP accesses of the Graphics Aperture <u>will not</u> be translated .....def
	1 AGP GA addresses <u>will</u> be translated

Note: For any master access to the Graphics Aperture range, snoop will not be performed.

**Device 0 Offset 84 - Graphics Aperture Size..... RW**

7-0	<b>Graphics Aperture Size</b>
	11111111 1M
	11111110 2M
	11111100 4M
	11111000 8M
	11110000 16M
	11100000 32M
	11000000 64M
	10000000 128M
	00000000 256M
3-0	Reserved .....always reads 0

**Offset 8B-88 - GA Translation Table Base ..... RW**

31-12	<b>Graphics Aperture Translation Table Base</b>
	Pointer to the base of the translation table in system memory used to map addresses in the aperture range (the pointer to the base of the "Directory" table).
11-3	Reserved .....always reads 0
2	<b>One Cycle TLB Flush Command</b>
	0 Disable.....default
	1 Enable .....should be set to 1
1	<b>Graphics Aperture Enable</b>
	0 Disable.....default
	1 Enable Graphics Aperture Address [31:28]
	Note: To disable the Graphics Aperture, set this bit to 0 and set all bits of the Graphics Aperture Size to 0. To enable the Graphics Aperture, set this bit to 1 and program the Graphics Aperture Size to the desired aperture size.
0	Reserved .....always reads 0

Note: If TLB miss, the TLB table is fetched by the address:

Gr Ap Trans Table Base [31:12] + A[27:22], A[21:12], 2'b00

## 8.9 AGP Control

### Device 0 Offset A3-A0 - AGP Capability Identifier .....RO

31-24	Reserved	.....always reads 00
23-20	Major Specification Revision	always reads 0001 Major revision # of AGP spec device conforms to
19-16	Minor Specification Revision	always reads 0000 Minor revision # of AGP spec device conforms to
15-8	Pointer to Next Item	...always reads 00 (last item)
7-0	AGP ID	(always reads 02 to indicate it is AGP)

### Device 0 Offset A7-A4 - AGP Status.....RO

31-24	Maximum AGP Requests	.....always reads 07 Max # of AGP requests the device can manage (8)
23-10	Reserved	.....always reads 0s
9	Supports SideBand Addressing	..always reads 1
8-2	Reserved	.....always reads 0s
1	2X Rate Supported	Value returned can be programmed by writing to RxAC[3]
0	1X Rate Supported	.....always reads 1

### Device 0 Offset AB-A8 - AGP Command..... RW

31-24	Request Depth (reserved for target)	always reads 0s
23-10	Reserved	.....always reads 0s
9	SideBand Addressing Enable	
	0	Disable.....default
	1	Enable
8	AGP Enable	
	0	Disable.....default
	1	Enable
7-2	Reserved	.....always reads 0s
1	2X Mode Enable	
	0	Disable.....default
	1	Enable
0	1X Mode Enable	
	0	Disable.....default
	1	Enable

**Device 0 Offset AC - AGP Control..... RW**

- 7 **Reserved** ..... always reads 0s
- 6 **AGP Read Synchronization**
  - 0 Disable..... default
  - 1 Enable (the CPU to PCI#2 cycle will be delayed if the CMFIFO contains a GART access)
- 5 **AGP Read Snoop CMFIFO**
  - 0 Disable..... default
  - 1 Enable (AGP read address will snoop the CMFIFO; if hit, AGP read will be started after the write is retired)
- 4 **PCI#2 Master Request has Higher Priority if AGPC is parking at AGP Master**
  - 0 Disable..... default
  - 1 Enable
- 3 **2X Rate Supported** (read also at Rx44[1])
  - 0 Not supported..... default
  - 1 Supported
- 2 **LPR In-Order Access (Force Fence)**
  - 0 Fence/Flush functions not guaranteed. AGP read requests (low/normal priority and high priority) may be executed before previously issued write requests. .... default
  - 1 Force all requests to be executed in order (automatically enables Fence/Flush functions). Low (i.e., normal) priority AGP read requests will never be executed before previously issued writes. High priority AGP read requests may still be executed prior to previously issued write requests as required.
- 1 **AGP Arbitration Parking**
  - 0 Disable..... default
  - 1 Enable (GGNT# remains asserted until either GREQ# de-asserts or data phase ready)
- 0 **2T AGP to DRAM Request Generation**
  - 0 Disable..... default
  - 1 Enable

**Device 0 Offset AD - AGP Latency Register..... RW**

- 7-4 **Reserved** ..... always reads 0s
- 3-0 **AGP Latency Timer(units of 16 GCLKs)**
  - 0000 Free Run..... default

**Device 0 Offset F7-F0 - BIOS Scratch Register ..... RW**

- 7-0 **No Hardware Function**

**Device 0 Offset F8 - DRAM Arbitration Timer 1..... RW**

- 7-4 **AGP Timer (units of 4 DRAM Clocks)**
- 3-0 **Host Timer (units of 4 DRAM Clocks)**

**Device 0 Offset F9 - DRAM Arbitration Timer 2..... RW**

- 7-4 **VGA High Priority Timer (units of 16 DRAM Clocks)**
- 3-0 **VGA Timer (units of 16 DRAM Clocks)**

**Device 0 Offset FA - CPU Direct Access Frame Buffer Base Address A[28:21]..... RW**

- 7-0 **A[28:21]**

**Device 0 Offset FB - Frame Buffer Control..... RW**

- 7 **VGA Enable**
  - 0 Disable..... default
  - 1 Enable
- 6 **VGA Reset** ..... (Write 1 to Reset)
- 5-4 **Frame Buffer Size**
  - 00 None default
  - 01 2M
  - 10 4M
  - 11 8M
- 3 **CPU Direct Access Frame Buffer**
  - 0 Disable..... default
  - 1 Enable
- 2-0 **CPU Direct Access Frame Buffer Base Address <31:29>**

**Device 0 Offset FC - Back Door Control 1..... RW**

- 7-2 **Reserved** ..... always reads 0
- 1 **Back-door MAX # of AGP Request Allowed**
  - 0 Read RxA7 will return 7 ..... default
  - 1 Read RxA7 will have number programmed at RxFD
- 0 **Back-Door Device ID Enable**
  - 0 Use Rx3-2's value for Rx3-2 read ..... default
  - 1 Use the value in RxFE-FF

**Device 0 Offset FD - Back Door Control 2..... RW**

- 7-3 **Reserved**
- 2-0 **Back-Door Max # of AGP Requests the Device can Handle**
  - 000 1-Request ..... default
  - 001 2-Requests
  - ... ..
  - 111 8-Requests

**Device 0 Offset FF-FE - Back Door Device ID ..... RW**

- 15-0 **Back-Door Device ID** ..... default = 0

### 8.9.1 Device 1 Header Registers - PCI-to-PCI Bridge

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number of 0 and function number equal to 0 and device number equal to one.

#### Device 1 Offset 1-0 - Vendor ID ..... RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

#### Device 1 Offset 3-2 - Device ID ..... RO

15-0 ID Code (reads 8501h to identify the CyberBlade i7 PCI-to-PCI Bridge device)

#### Device 1 Offset 5-4 - Command ..... RW

- 15-10 Reserved ..... always reads 0
- 9 Fast Back-to-Back Cycle Enable ..... RO
  - 0 Fast back-to-back transactions only allowed to the same agent ..... default
  - 1 Fast back-to-back transactions allowed to different agents
- 8 SERR# Enable ..... RO
  - 0 SERR# driver disabled ..... default
  - 1 SERR# driver enabled

(SERR# is used to report parity errors if bit-6 is set).
- 7 Address / Data Stepping ..... RO
  - 0 Device never does stepping ..... default
  - 1 Device always does stepping
- 6 Parity Error Response ..... RW
  - 0 Ignore parity errors & continue ..... default
  - 1 Take normal action on detected parity errors
- 5 VGA Palette Snoop ..... RO
  - 0 Treat palette accesses normally ..... default
  - 1 Don't respond to palette writes on PCI bus (10-bit decode of I/O addresses 3C6-3C9 hex)
- 4 Memory Write and Invalidate Command ..... RO
  - 0 Bus masters must use Mem Write ..... default
  - 1 Bus masters may generate Mem Write & Inval
- 3 Special Cycle Monitoring ..... RO
  - 0 Does not monitor special cycles ..... default
  - 1 Monitors special cycles
- 2 Bus Master ..... RW
  - 0 Never behaves as a bus master
  - 1 Enable to operate as a bus master on the primary interface on behalf of a master on the secondary interface ..... default
- 1 Memory Space ..... RW
  - 0 Does not respond to memory space
  - 1 Enable memory space access ..... default
- 0 I/O Space ..... RW
  - 0 Does not respond to I/O space
  - 1 Enable I/O space access ..... default

#### Device 1 Offset 7-6 - Status (Primary Bus) ..... RWC

- 15 Detected Parity Error ..... always reads 0
- 14 Signaled System Error (SERR#) ..... always reads 0
- 13 Signaled Master Abort
  - 0 No abort received ..... default
  - 1 Transaction aborted by the master with Master-Abrort (except Special Cycles) ..... write 1 to clear
- 12 Received Target Abort
  - 0 No abort received ..... default
  - 1 Transaction aborted by the target with Target-Abrort ..... write 1 to clear
- 11 Signaled Target Abort ..... always reads 0
- 10-9 DEVSEL# Timing
  - 00 Fast
  - 01 Medium always reads 01
  - 10 Slow
  - 11 Reserved
- 8 Data Parity Error Detected ..... always reads 0
- 7 Fast Back-to-Back Capable ..... always reads 0
- 6 User Definable Features ..... always reads 0
- 5 66MHz Capable ..... always reads 1
- 4 Supports New Capability list ..... always reads 0
- 3-0 Reserved ..... always reads 0

#### Device 1 Offset 8 - Revision ID ..... RO

7-0 CyberBlade i7 Chip Revision Code (00=First Silicon)

#### Device 1 Offset 9 - Programming Interface ..... RO

This register is defined in different ways for each Base/Sub-Class Code value and is undefined for this type of device.

7-0 Interface Identifier ..... always reads 00

#### Device 1 Offset A - Sub Class Code ..... RO

7-0 Sub Class Codereads 04 to indicate PCI-PCI Bridge

#### Device 1 Offset B - Base Class Code ..... RO

7-0 Base Class Codereads 06 to indicate Bridge Device

#### Device 1 Offset D - Latency Timer ..... RO

7-0 Reserved ..... always reads 0

#### Device 1 Offset E - Header Type ..... RO

7-0 Header Type Code ..... reads 01: PCI-PCI Bridge

#### Device 1 Offset F - Built In Self Test (BIST) ..... RO

- 7 BIST Supported .reads 0: no supported functions
- 6 Start Test .....write 1 to start but writes ignored
- 5-4 Reserved ..... always reads 0
- 3-0 Response Code... 0 = test completed successfully

**Device 1 Offset 18 - Primary Bus Number..... RW**

7-0 Primary Bus Number..... default = 0

This register is read write, but internally the chip always uses bus 0 as the primary.

**Device 1 Offset 19 - Secondary Bus Number..... RW**

7-0 Secondary Bus Number..... default = 0

Note: PCI#2 must use these bits to convert Type 1 to Type 0.

**Device 1 Offset 1A - Subordinate Bus Number..... RW**

7-0 Primary Bus Number..... default = 0

Note: PCI#2 must use these bits to decide if Type 1 to Type 1 command passing is allowed.

**Device 1 Offset 1C - I/O Base ..... RW**

7-4 I/O Base AD[15:12] ..... default = 1111b

3-0 I/O Addressing Capability ..... default = 0

**Device 1 Offset 1D - I/O Limit ..... RW**

7-4 I/O Limit AD[15:12] ..... default = 0

3-0 I/O Addressing Capability ..... default = 0

**Device 1 Offset 1F-1E - Secondary Status ..... RO**

15-0 Reserved ..... always reads 0000

**Device 1 Offset 21-20 - Memory Base ..... RW**

15-4 Memory Base AD[31:20] ..... default = 0FFFh

3-0 Reserved ..... always reads 0

**Device 1 Offset 23-22 - Memory Limit (Inclusive)..... RW**

15-4 Memory Limit AD[31:20] ..... default = 0

3-0 Reserved ..... always reads 0

**Device 1 Offset 25-24 - Prefetchable Memory Base.. RW**

15-4 Prefetchable Memory Base AD[31:20]def = 0FFFh

3-0 Reserved ..... always reads 0

**Device 1 Offset 27-26 - Prefetchable Memory Limit.. RW**

15-4 Prefetchable Memory Limit AD[31:20] ..... default = 0

3-0 Reserved ..... always reads 0

**Device 1 Offset 3F-3E – PCI-to-PCI Bridge Control .. RW**

15-4    **Reserved** .....always reads 0

3        **VGA-Present on AGP**

0        Forward VGA accesses to PCI Bus #1 . default

1        Forward VGA accesses to PCI Bus #2 / AGP

Note: VGA addresses are memory A0000-BFFFFh and I/O addresses 3B0-3BBh, 3C0-3CFh and 3D0-3DFh (10-bit decode). "Mono" text mode uses B0000-B7FFFh and "Color" Text Mode uses B8000-BFFFFh. Graphics modes use Axxxxh. Mono VGA uses I/O addresses 3Bx-3Cxh and Color VGA uses 3Cx-3Dxh. If an MDA is present, a VGA will not use the 3Bxh I/O addresses and B0000-B7FFFh memory space; if not, the VGA will use those addresses to emulate MDA modes.

2        **Block / Forward ISA I/O Addresses**

0        Forward all I/O accesses to the AGP bus if they are in the range defined by the I/O Base and I/O Limit registers (device 1 offset 1C-1D)

..... default

1        Do not forward I/O accesses to the AGP bus that are in the 100-3FFh address range even if they are in the range defined by the I/O Base and I/O Limit registers.

1-0    **Reserved** .....always reads 0

## 8.9.2 Device 1 Configuration Registers - PCI-to-PCI Bridge

### PCI Bus #2 Control

#### Device 1 Offset 40 - CPU-to-PCI #2 Flow Control 1... RW

- 7 **CPU-PCI #2 Post Write**
  - 0 Disable default
  - 1 Enable
- 6 **CPU-PCI #2 Dynamic Burst**
  - 0 Disable default
  - 1 Enable
- 5 **CPU-PCI #2 One Wait State Burst Write**
  - 0 Disable default
  - 1 Enable
- 4 **PCI #2 to DRAM Prefetch**
  - 0 Disable default
  - 1 Enable
- 3 **PCI Master Allowed Before CPU-to-PCI Post Write Buffer is not Flushed**
  - 0 Disable default
  - 1 Enable

This option is always enabled for PCI #1
- 2 **MDA Present on PCI #2**
  - 0 Forward MDA accesses to AGP ..... default
  - 1 Forward MDA accesses to PCI #1

Note: Forward despite IO / Memory Base / Limit  
Note: MDA (Monochrome Display Adapter) addresses are memory addresses B0000h-B7FFFh and I/O addresses 3B4-3B5h, 3B8-3BAh, and 3BFh (10-bit decode). 3BC-3BE are reserved for printers.  
Note: If Rx3E bit-3 is 0, this bit is a don't care (MDA accesses are forwarded to the PCI bus).
- 1 **PCI #2 Master Read Caching**
  - 0 Disable default
  - 1 Enable
- 0 **PCI #2 Delay Transaction**
  - 0 Disable default
  - 1 Enable

  - 0 Disable default
  - 1 Enable

This bit is normally set to 1.
- 3 **PCI #2 Delay Transaction Timeout**
  - 0 Disable default
  - 1 Enable
- 2 **Prefetch During Delay Transaction**
  - 0 Enable default
  - 1 Disable
- 1-0 **Reserved** ..... always reads 0

## 8.10 2D / 3D Graphics Accelerator Registers

### 8.10.1 PCI Configuration Registers – Graphics Accelerator

The CyberBlade i7 Graphics Accelerator is fully compliant with PCI bus interface protocol revision 2.1. The controller implements slave functions of PCI to accept cycles initiated by PCI masters targeted for its internal registers, RAMDAC™, frame buffer, and/or BIOS. It will accept only one data transaction for non-memory type transfers; however burst read/write transfers for frame buffer accesses are also implemented for performance enhancement. Bursting is disabled when accessing memory mapped I/O. Data parity will be generated for read cycles.

To support the PC AT architecture, palette snooping is supported. There are two different palette snooping modes: (1) snooping due to PCI retry, and (2) snooping due to master abort. Both modes are supported. The video BIOS will automatically determine the correct snooping mode in a PCI based system during power up. The CyberBlade i7 follows the PCI 2.1 specification running at 33 MHz or lower system clock frequencies. For packed pixel modes, if the first data TRDY is not generated within 16 clocks, a retry will be issued. During bursting, if successful data is not generated within 8 clocks, a retry will also be issued.

The table below lists the commands implemented by the CyberBlade i7 graphics controller PCI interface. Note that codes not listed (0000 interrupt acknowledge, 0001 special cycle, 0100, 0101, 1000, 1001 reserved, and 1101 dual address cycle) are not decoded and DEVSEL# is not generated. No action takes place inside the chip for these codes.

**Table 8-4. Supported PCI Command Codes**

Command Code	Command
0010	I/O Read
0011	I/O Write
0110	Memory Read
0111	Memory Write
1010	Configuration Read
1011	Configuration Write
1100	Memory Read Multiple (treated as simple memory read)
1110	Memory Read Line (treated as simple memory read)
1111	Memory Write and Invalid (treated as simple memory write)

The PCI configuration space is fully implemented. Due to the second memory base register, all I/O registers can be memory mapped; which allows more than one graphics controller to be installed within a system by mapping memory and I/O to different locations.

All configuration registers are located in PCI configuration space and should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number equal to one and function number and device number equal to zero.

There are three memory base registers. The first defines the memory base location for the graphics frame buffer. The second defines the memory base for the memory mapped I/O locations. The third defines the memory base for the second video aperture. With this second aperture, graphics data and video data can be sent to the CyberBlade i7 simultaneously.

The CyberBlade i7 supports the PCI Bus Master mode which can send captured video data directly to system memory for processing. The registers to control the PCI Bus Master are defined in following sections (they are all in PCI configuration space).

#### Device 0 Offset 1-0 - Vendor ID .....RO

**15-0 ID Code** (reads 1023h to identify TRIDENT MICROSYSTEMS INC.)

#### Device 0 Offset 3-2 - Device ID .....RO

**15-0 ID Code** (reads 8420h to identify the CyberBlade i7 graphics controller)

**Device 0 Offset 5-4 - Command..... RW**

15-10	Reserved	.....always reads 0
9	<b>Fast Back-to-Back Cycle Enable</b>	..... RO ..... default set from inverse of MA
	0	Fast back-to-back transactions only allowed to the same agent
	1	Fast back-to-back transactions allowed to different agents
8	<b>SERR# Enable</b>	..... RO
	0	SERR# driver disabled..... default
	1	SERR# driver enabled
	(SERR# is used to report parity errors if bit-6 is set).	
7	<b>Address / Data Stepping</b>	..... RO
	0	Device never does stepping ..... default
	1	Device always does stepping
6	<b>Parity Error Response</b>	..... RO
	0	Ignore parity errors & continue ..... default
	1	Take normal action on detected parity errors
5	<b>VGA Palette Snoop</b>	<b>RW</b>
	0	Treat palette accesses normally ..... default
	1	Don't respond to palette accesses on PCI bus
4	<b>Memory Write and Invalidate Command</b>	..... RO
	0	Bus masters must use Mem Write ..... default
	1	Bus masters may generate Mem Write & Inval
3	<b>Special Cycle Monitoring</b>	..... RO
	0	Does not monitor special cycles ..... default
	1	Monitors special cycles
2	<b>Bus Master</b>	<b>RW</b>
	0	Never behaves as a bus master ..... default
	1	Can behave as a bus master
1	<b>Memory Space</b>	<b>RW</b>
	0	Does not respond to memory space
	1	Responds to memory space..... default
0	<b>I/O Space</b>	<b>RW</b>
	0	Does not respond to I/O space
	1	Responds to I/O space ..... default

**Device 0 Offset 7-6 - Status.....RWC**

15	<b>Detected Parity Error</b>	
	0	No parity error detected .....default
	1	Error detected in either address or data phase. This bit is set even if error response is disabled (command register bit-6)..... write one to clear
14	<b>Signaled System Error (SERR# Asserted)</b>	..... always reads 0
13	<b>Signaled Master Abort (Bus Master Only)</b>	
	0	No abort received .....default
	1	Transaction aborted by the master ..... write one to clear
12	<b>Received Target Abort (Bus Master Only)</b>	
	0	No abort received .....default
	1	Transaction aborted by the target..... write 1 to clear
11	<b>Signaled Target Abort</b>	..... always reads 0
	0	Target Abort never signaled
10-9	<b>DEVSEL# Timing</b>	
	00	Fast
	01	Mediumalways reads 01
	10	Slow
	11	Reserved
8	<b>Data Parity Error Detected (Bus Master Only)</b>	
	0	No data parity error detected ... always reads 0
	1	Error detected in data phase
7	<b>Fast Back-to-Back Capable</b>	..... default set from inverse of MA
	0	Not capable
	1	Capable
6	<b>Reserved</b>	always reads 0
5	<b>66MHz Capable</b>	always reads 1
4	<b>Supports New Capability list</b>	..... always reads 0
3-0	<b>Reserved</b>	always reads 0

**Device 0 Offset 8 - Revision ID..... RO**

8-0 CyberBlade i7 Graphics Controller Revision Code

**Device 0 Offset 9 - Programming Interface ..... RO**

7-0 Interface Identifier .....always reads 00

**Device 0 Offset A - Sub Class Code..... RO**

7-0 Sub Class Code.....always reads 00

**Device 0 Offset B - Base Class Code..... RO**

7-0 Base Class Code  
Reads 03 to indicate Graphics Controller

**Device 0 Offset 13-10 - Graphics Memory Base 0..... RW**

31-0 Graphics Memory Base 0.....default = E000 0000  
Defines an 8MB space for display memory

**Device 0 Offset 17-14 - Graphics Memory Base 1..... RW**

31-0 Graphics Memory Base 0.....default = E080 0000  
Defines a 128KB space for memory mapped I/O

**Device 0 Offset 1B-18 - Graphics Memory Base 2..... RW**

31-0 Graphics Memory Base 0.....default = E040 0000  
Defines an 8MB space for off-screen video overlay

**Device 0 Offset 2D-2C – Subsystem Vendor ID ..... RW**

15-0 Subsystem Vendor ID .....default = 00

**Device 0 Offset 2F-2E - Subsystem ID ..... RW**

15-0 Subsystem ID .....default = 00

**Device 0 Offset 33-30 –Graphics ROM Base..... RW**

31-0 Graphics ROM Base..... default = 0000 0001

**Device 0 Offset 3C – Interrupt Line ..... RW**

7-0 Interrupt Line .....default = 0Bh

**Device 0 Offset 3D – Interrupt Pin..... RO**

7-0 Interrupt Pin ..... always reads 01h (INTA#)

### Interrupts

There are several interrupt sources and their corresponding controls in the CyberBlade i7 as shown in the following table:

**Table 8-5. Interrupt Sources and Controls**

Source	Mask	Clear	Status
Capture <sup>3</sup>	CR9B[7]	CR9B[6] <sup>1</sup>	CR9B[4]
Capture VSYNC	<sup>2</sup>		
Capture Even Field	<sup>2</sup>		
Capture Odd Field	<sup>2</sup>		
Capture Blank	<sup>2</sup>		
GE <sup>4</sup>	2122[7]	2122[7]	2120[4]
VGA <sup>5</sup>	CR11[5]	CR11[4]	

1) Write 0 to clear.

2) Selected by CR9E[7:6]

3) Video capture logic can generate an interrupt which is selected from one of four sources determined by CR9E.[7:6]. This interrupt is enabled by CR9B[7]. To clear this bit write 0 to CR9B[6]. Whether an interrupt is generated can be determined from CR9B[4].

4) The GE interrupt is similar to the capture interrupt.

5) The VGA interrupt is similar to the capture interrupt except that there is no status bit.

## 8.10.2 PCI Device-Specific Config Regs – Graphics Accelerator

### Offset 93-90 – Power Management 1.....RO

31-27	Reserved	.....always reads 0
	PME# not supported	
26	D2 State (Suspend) Supported	.....always reads 1
	The D2 state is supported	
25	D1 State (Standby) Supported	.....always reads 1
	The D1 state is supported	
24-22	Reserved	.....always reads 0
21	Device Specific Initialization	.....always reads 1
	Special DSI is required from the video BIOS	
20	Reserved	.....always reads 0
	Auxiliary power source not supported	
19	Reserved	.....always reads 0
	PME# generation not supported	
18-16	PCI PM Version #	.....always reads 001b
15-8	Next Item Pointer	.....always reads 0
7-0	PCI PM Capable	.....always reads 01h
	This device is PCI PM capable	

### Offset 97-94 – Power Management 2.....RW

31-24	Reserved	.....always reads 0
	Power dissipation reporting not supported	
23-16	Reserved	.....always reads 0
15	D3 Cold Supported	.....always reads 0
	D3 cold not supported	
14-13	Data Scale	always reads 0
	Power dissipation reporting not supported	
12-9	Power Consumed / Dissipated	.....always reads 0
	Power dissipation reporting not supported	
8	Reserved	.....always reads 0
	PME# for D3 cold not supported	
7-2	Reserved	.....always reads 0
1-0	Power State	
	00 Fully On	.....default
	01 Standby	
	10 Suspend	
	11 D3hot, similar to suspend	

### 8.10.3 Graphics Accelerator PCI Bus Master Registers

The CyberBlade i7 PCI Bus Master controller supports both read/write and scatter/gather. Software can take advantage of this feature to transfer data between system memory and the frame buffer. After software sets the proper registers and commands, the PCI master begins to transfer data automatically between system memory and the frame buffer. This allows the CPU to do other jobs at the same time, thus increasing performance.

Software should use the PCI Bus Master functionality to transfer big chunks of data such as video capture data for video conferencing applications or texture data for 3-D applications. For small chunks of data, direct CPU access to the Frame Buffer is the preferred method.

The software sequence used to control bus master operation is as follows: Software first sets registers such as the system memory starting address, page table starting address / height / width, and frame buffer starting address and line offset. Software finally sets the bus master control register where either bit 1 (for reads) or bit 2 (for writes) is set as the command bit. After the command bit is set, the hardware will begin to transfer data automatically based on the parameters specified. After the transfer is finished, the hardware will issue an interrupt. Software can then poll the status bit to get the transfer status. The hardware will clear the command bit after the transfer is finished. Software cannot issue new commands until the previous command is completed.

All Registers are memory mapped. The memory address base is defined in PCI configuration register "Memory Base 1" (offset 17h-14h).

#### Port 2204 – Graphics Bus Master Status ..... RO

31-3	Reserved	..... always reads 0
2	Bus Master Interrupt Status	
1	End of Transfer	
	0	Still processing ..... default
	1	End of Transfer (Idle)
0	Bus Master Error Status	
	0	Normal default
	1	Error Detected

This error is usually detected because the total page table size is less than the size defined in the "Graphics Bus Master Height" register at index 2314h.

#### Port 2300 – Graphics Bus Master Control..... RW

31-16	Reserved	..... always reads 0
15	PCI Master Read Data to GE SRCQ	
	0	Disable default
	1	Enable
14-11	Bytes in DW to be Cleared	
	When enabling block transfer with clear, one bits define which byte(s) in the DW will be cleared	
10	Enable Bit with Clear	
	0	Disable default
	1	Enable
9	Invert C / Z Position	
	0	Hardware assumes C is located in bits 15:0 and Z in bits 31:16 .....default
	1	Hardware assumes C is located in bits 31:16 and Z in bits 15:0
8	Enable Z Stripping	
	0	Disable default
	1	Enable
7-5	Reserved	..... always reads 0
4	Bus Master Interrupt	
	0	Disable default
	1	Enable
3	Master Latency	
	0	Disable default
	1	Enable
2	Write Command	.....default =0
	Writing this bit to 1 will trigger the hardware to begin a write operation. After finishing the operation, hardware will automatically clear this bit.	
1	Read Command	.....default =0
	Writing this bit to 1 will trigger the hardware to begin a read operation. After finishing the operation, hardware will automatically clear this bit.	
0	Scatter / Gather	
	0	Disable default
	1	Enable

**Port 2310 – Graphics Bus Master System Start AddrRW**

**31-0 System Start Address**

If scatter / gather is enabled, bits 31:12 point to the physical region translation table (the page starting address must be aligned on 4KB address boundaries) and bits 11:0 are the offset within a page.

**Physical Region Descriptor Table**

While system memory is allocated in a non-contiguous space, software needs to provide a physical region description table in system memory and pass the table's starting address to hardware.

The table size must less than or equal to 4K bytes and the table cannot cross the 4K boundary.

BYTE3	BYTE2	BYTE1	BYTE0
Page 0 physical address			EOT
Page 1 physical address			EOT
.....			
Page n physical address			EOT

EOT = End of Table

**Figure 8-2. Physical Region Descriptor Table Format**

Each table entry is 4 bytes in length. Hardware assumes that the physical page is always 4K. Bits 31:2 indicate the physical page starting address. Bit 0 of the first byte indicates the end of the table. Bus Master operation terminates when the last descriptor has been retired.

**Port 2314 – Graphics Bus Master Height ..... RW**

15-10 Reserved ..... always reads 0  
9-0 Source Data Height

**Port 2316 – Graphics Bus Master Width ..... RW**

15-12 Reserved ..... always reads 0  
11-0 Source Data Width (in bytes)

**Port 2318 – Graphics Bus Master FB Start Addr/PitchRW**

31-22 Frame Buffer Line Offset (FB pitch) in quadwords  
21-20 Reserved ..... always reads 0  
19-0 Frame Buffer Start Address (quadword aligned)

**Port 231C – Graphics Bus Master System Pitch ..... RW**

15-12 Reserved ..... always reads 0  
11-0 System Row Byte Offset (pitch) in bytes

**Port 2320 – Graphics Bus Master Clear Data ..... RW**

31-0 Clear Data Value  
Used as the "clear" value for "block transfer with clear"

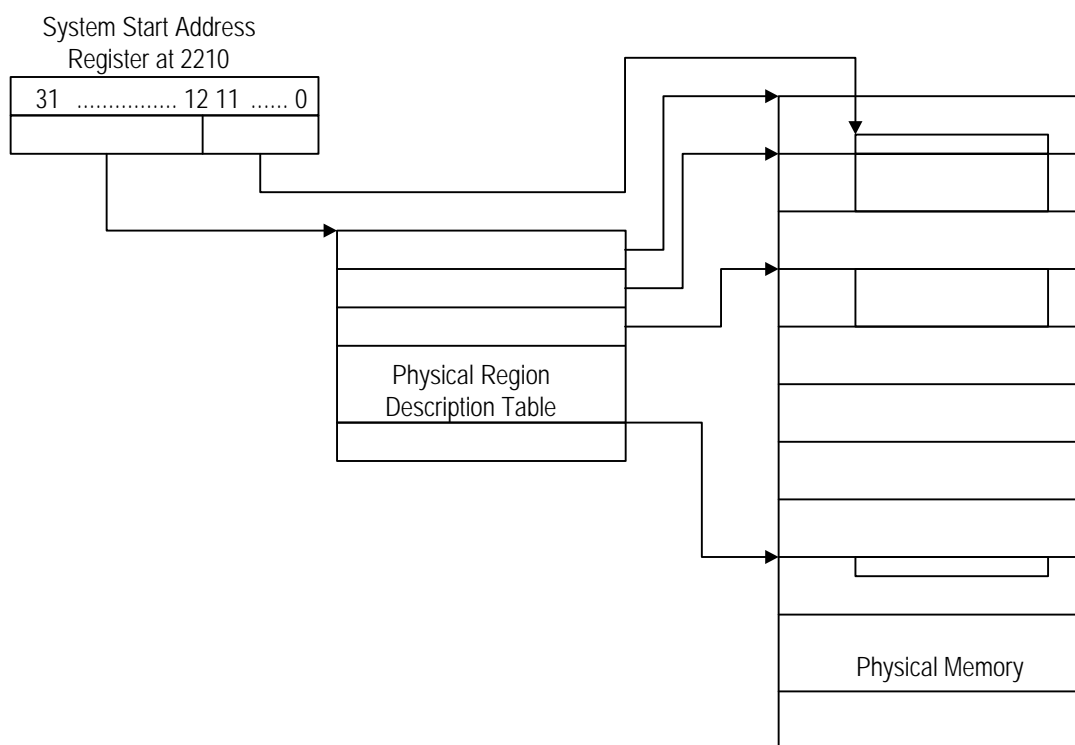

Figure 8-3. PCI Bus Master Address Translation

### Graphics Accelerator AGP Registers

The default base I/O address for the AGP registers is 2300h.

The AGP control unit has 3 channels. These channels can work independently and in parallel. Each channel has its own capabilities:

Channel 0: Execution mode texture access.

Channel 1: Command List Operation. Executes command lists from AGP memory.

Channel 2: Data Move. Moves data from AGP memory to frame buffer or to the Capture/MPEG2 FIFO. Also moves data from the frame buffer to AGP memory.

### Graphics AGP Configuration Registers

#### Port 2304 – Graphics AGP Capability List ..... RW

31-0 xx

#### Port 2334 – Graphics AGP Capability List Address.. RW

31-0 xx

### Graphics AGP Operation Registers

#### Port 2340 – Graphics AGP FB Command List Start.. RW

31-19 Reserved .....always reads 0

18-0 Frame Buffer Command List Start Address

#### Port 2344 – Graphics AGP FB Command List Size... RW

31-19 Reserved .....always reads 0

18-3 Frame Buffer Command List Size (in quadwords)  
Value programmed is the desired size minus one

2-0 Reserved .....always reads 0

### Command List Format

The command list is stored in AGP memory in groups. Each group has the following format:

	Bit			Bit		
QuadWord	63	48	32	31	16	0
0	Data 0			Header		
1	Data 2			Data 1		
2	Data 4			Data 3		
...	...			...		

n / 2 + 1 Pad/Data n-1 Data n – 1/2

The header is a 32-bit word that contains information about this group, such as the amount of useful data in the group. A group is always padded to a quadword boundary. Padding DWORDs are discarded by the channel. The format of the header is as follows:

#### 31 Consecutive Addressing

- 0 Disabled (all data in this group will be written to the register with the destination address specified in the "ADDR" field in bits 29-8)
- 1 Enabled (All data in this group will be written to registers ADDR, ADDR+4, ... ADDR+4 \* (LEN-1) sequentially)

#### 30 Wait

- 0 Don't Wait (send data to the Graphics Engine as long as it can receive it)
- 1 Wait (until the GE is idle, then send data)

#### 29-8 Register Address of the First Data (ADDR)

#### 15-0 Number of DWORDs of Data in this Group (LEN)

### Port 2348 – Graphics AGP Channel 1 FB Start/Pitch RW

31-22	Frame Buffer Line Offset (in quadwords)
21-19	Reserved .....always reads 0
18-0	Frame Buffer Starting Address

### Port 234C – Graphics AGP Channel 1 FB Size ..... RW

31-13	X Direction (in quadwords minus one)
12-10	Reserved .....always reads 0
9-0	Y Direction (in pixels minus one)

### Port 2350 – Graphics AGP Channel 1 System Start... RW

31-3	Channel 1 System Memory Start Address (quadword aligned)
2-1	Reserved .....always reads 0
0	Command List Operation Trigger

This bit is the same as bit-19 of register 2368h (Channel 1 Read Enable). It is used to trigger command list operation and force bit-17 of register 2368h (Channel 1 Destination Select) to 1 (to select the GE Command FIFO).

### Port 2354 – Graphics AGP Chan 1/2 System Pitch... RW

31-27	Reserved .....always reads 0
26-16	Ch 2 System Memory Line Offset (in quadwords)
15-11	Reserved .....always reads 0
10-0	Ch 1 System Memory Line Offset (in quadwords)

### Port 2358 – Graphics AGP Channel 2 System Start.. RW

31-3	Channel 2 System Memory Start Address (quadword aligned)
2-0	Reserved .....always reads 0

### Port 235C – Graphics AGP Channel 2 FB Start/Pitch RW

31-22	Frame Buffer Line Offset (in quadwords)
21-19	Reserved .....always reads 0
18-0	Frame Buffer Starting Address

### Port 2360 – Graphics AGP Channel 2 FB Size ..... RW

31-27	Reserved .....always reads 0
26-16	Ch 2 System Memory Line Offset (in quadwords)
15-11	Reserved .....always reads 0
10-0	Ch 1 System Memory Line Offset (in quadwords)

### Port 2364 –Channel Arbitration Counter Threshold . RW

31-28	Reserved .....always reads 0
26-24	Channel 2 System Arbitration Threshold
23-20	Channel 2 System Arbitration Threshold
19-16	Channel 2 System Arbitration Threshold
15-0	Reserved .....always reads 0

### Port 2368 – Graphics AGP Channel I/O Control..... RW

31-27	Reserved .....always reads 0
26	Reserved (Do not Program) .....must be 0
25	Reserved .....always reads 0
24	Reserved (Do not Program) .....must be 0
23-22	Reserved .....always reads 0
21-20	Reserved (Do not Program) .....must be 01
19	Channel 1 Read Enable
	0 Disable.....default
	1 Enable
18	Channel 1 Interrupt Enable
	0 Disable.....default
	1 Enable
17	Channel 1 Destination Select
	0 Frame Buffer.....default
	1 GE Command FIFO
16	Channel 1 Enable
	0 Disable.....default
	1 Enable
15-1	Reserved .....always reads 0
0	Channel 0 Enable
	0 Disable.....default
	1 Enable

**Port 236C – Graphics AGP Global & Chan 2 Control RW**

31-26	Reserved .....	always reads 0
25-24	Sideband Address (SBA) Standby Latency Timer	
23	High Priority Command Enable	
	0 Disable .....	default
	1 Enable

### Command List Operation

The CyberBlade i7 implements an internal block called the "Command List Control Unit" to process command lists. Command list operation is invisible to software. After initialization of the Command List Control Unit, software can set registers as if there is no Command List Control Unit. If an engine is idle and there are no pending commands in the command buffer, data will be passed to the corresponding register directly. Otherwise, address and data will be stored into the command buffer to be processed later. When the engine is idle, the Command List Control Unit will fetch commands from the command buffer which is located in video memory and send it to the engine. There are two registers that determine the lower and upper bounds of the command buffer, the Command Buffer Start and Command Buffer End registers. The Command List Control Unit uses the command buffer in a round robin fashion, i.e., the address is wrapped around when it passes the end of the buffer.

Registers in the Setup Engine, Rasterization Engine, Pixel Engine, Memory Interface, and data from the host CPU and the drawing environment can be buffered by the Command List Control Unit. Command List Control registers and VGA extension registers cannot be buffered. Every entry in the command buffer is 64-bit with the lower 32 bits for the register address and the higher 32 bits for register data. In order to optimize memory bandwidth usage, the Command List Control Unit maintains one read and one write FIFO in its interface to memory in order to burst information from the read/write command list.

### Port 23B0 –Command Buffer Start Address ..... RW

- 31-30 Command List Mode**  
00 Disable Command Buffer.....default  
01 Enable Command Buffer  
10 Flush Command Buffer Then Disable (after first completing any commands in the existing command buffer)  
11 -reserved-  
**29-24 Reserved** ..... always reads 0

**23-0 Command Buffer Start Address**

Starting address of the command buffer in bytes (quadword aligned). Writing to this register will set the internal buffer start and end pointers to this address.

### Port 23B0 –Command Buffer End Address ..... RW

- 31-24 Reserved** ..... always reads 0

**23-0 Command Buffer End Address**

End address of the command buffer in bytes (quadword aligned). This address should be programmed to one more than the address of the last byte of the command buffer.

## VGA Standard Registers - Introduction

The standard VGA register set consists of five sets of indexed registers plus several individually addressed registers. All VGA registers are addressed at specific I/O port addresses defined by the VGA legacy standard.

The non-indexed registers (also called the "Status / Enable" registers) are:

- Input Status Register 0 Read at 3C2
- Input Status Register 1 Read at 3BA or 3DA
- Miscellaneous Register Read at 3CC, Write at 3C2
- Video Subsystem Enable Read/Write at 3C3
- Display Adapter Enable Read/Write at 46E8

The indexed register sets each control different functional blocks inside the hardware VGA logic. These register sets are:

- Attribute Controller 21 registers (0-14h) at 3C0/1
- Sequencer 5 registers (0-4h) at 3C4/5
- Graphics Controller 9 registers (0-8h) at 3CE/F
- CRT Controller 25 registers (0-18h) at 3x4/5
- RAMDAC 256 24-bit registers at 3C7-3C9

Indexed registers typically require two sequential port addresses, the first of which is the index and the second of which is the data. In other words, the index is written to the first port address and then the data corresponding to that indexed register is read from or written to the second port address. The exceptions to this are the Attribute Controller and the RAMDAC. For the Attribute Controller, the index is written at 3C0 as expected. Data reads (but not writes) can be performed from port 3C1 in the standard way. However, generally most data read and all data write operations use the same 3C0 port as used for the index. Data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed (reads from 3BA or 3DA reset the flag to point at the index register). The other exception to the 2-port index/data structure is the RAMDAC which uses three port addresses. In this case, there are two locations provided for the index, 3C7 and 3C8, with the data at 3C9. There is actually only one index register, but automatic pre / post incrementation is performed differently depending on whether the index is written at the "Read" address (3C7) or the "Write" address (3C8). The current index value may be read at 3C8. Refer to the RAMDAC register group for further explanation of the operation of the index registers and sequential access to the three data bytes of each indexed data location.

The number of registers listed above for each indexed register group is the number of registers defined by the VGA standard. The operation of these "base" registers will always be exactly the same from one vendor's implementation of the VGA to another. Typically, however, there are additional

non-standard / extended functions implemented in higher numbered index values. That is the case for this chip as well, where extended functions are provided in all indexed register groups except the Attribute Controller (due to the unusual nature of Attribute Controller indexing using a single I/O port which makes access to this register group more cumbersome). This document will detail the functions of all the standard VGA registers first. All extended functions will then be separately documented in following sections.

Regarding notation used in this document, indexed registers (including extended registers) may be referenced using a 2-letter mnemonic from the following table followed by the index number:

Attribute Controller	AR
Graphics Controller	GR
CRT Controller	CR
Sequencer	SR

For example, index register 26h of the 3CE / 3CFh indexed register group could also be referred to as GR26. Bit-7 if this register, using this notation, would be GR26[7].

Register groups, for the most part, are included in this document in order by I/O port address. Some registers are included out of order with other registers in the same functional block. Refer to the table of contents and the register summary tables at the beginning of the register section of this document for further information and help in finding descriptive information for a specific register.

For standard VGA registers, primarily only the bit definitions are provided here. Since the operation of these bits was standardized long ago, full explanation of the operation of these bits is not provided in this document. Detailed explanation of these bits is provided by many fine industry publications (check your local computer book store or the internet for further information).

## Capture / ZV Port Registers

### Port 2200 – Capture / ZV Port Command ..... RW

31-28	Reserved	.....always reads 0
27-24	Address 1	
23-20	Reserved	.....always reads 0
19-16	Address 0	
15-8	Data 1	
7-0	Data 0

1	<b>MC Buffer is Field</b>	
	0	Not Field..... default
	1	Field
0	<b>MC Command in Queue</b>	
	0	Disable..... default
	1	Enable

This register changes definition when written with bit-0 = 1. This address then becomes "MC Status" with the definition of the bits matching the following bit definitions until MC-Status bit-0 is cleared by hardware.

## Port 2285-2284 – MC Status ..... RW

15	Task Pop Out Done Status	
14-12	FIFO Status	
11	<b>MC Decode Done Status</b>	
10-9	<b>Video Output Display Fields</b>	
	00	-reserved- .....default
	01	Top
	10	Bottom
	11	Both
8-6	<b>Video Output Display Buffer</b>	
	000	F0 default
	001	F1
	010	F2
	011	F3
	100	H0
	101	H1
	110	H2
	111	-reserved-
5-4	<b>MC Buffer 2</b>	
	<u>Bit-1 = 1</u>	<u>Bit-1 = 0</u>
	00	H0 top
	01	H1 bottom
	10	H2 both
	11	No Buf 2 n/a
3-2	<b>MC Buffer 1</b>	
	<u>Bit-1 = 1</u>	<u>Bit-1 = 0</u>
	00	H0 F0
	01	H1 F1
	10	H2 F2
	11	n/a F3
1	<b>MC Buffer is Field</b>	
	0	Not Field .....default
	1	Field
0	<b>MC Status</b>	
	0	Not in progress.....default
	1	In Progress

The bit definitions above are valid only when bit-0 is equal to 1. When hardware clears bit-0, bit definitions revert to those defined by the "MC Command Queue" register defined in the left hand column of this page.

**Port 228B-2288 – MC Y-Reference Address..... RW**

31-20 Reserved .....always reads 0  
19-0 Y-Reference Start Address (quadword aligned)

**Port 228F-228C – MC U-Reference Address ..... RW**

31-20 Reserved .....always reads 0  
19-0 U-Reference Start Address (quadword aligned)

**Port 2293-2290 – MC V-Reference Address ..... RW**

31-20 Reserved .....always reads 0  
19-0 V-Reference Start Address (quadword aligned)

**Port 2297-2294 – MC Display Y-Address Offset..... RW**

31-20 Reserved .....always reads 0  
19-0 Y Address Offset  
Y address offset (quadword aligned) of first display pixel relative to the first pixel (top left hand corner) of the picture.

**Port 229B-2298 – MC Display U-Address Offset ..... RW**

31-20 Reserved .....always reads 0  
19-0 U Address Offset  
U address offset (quadword aligned) of first display pixel relative to the first pixel (top left hand corner) of the picture.

**Port 229F-229C – MC Display V-Address Offset ..... RW**

31-20 Reserved .....always reads 0  
19-0 V Address Offset  
V address offset (quadword aligned) of first display pixel relative to the first pixel (top left hand corner) of the picture.

**Port 22A0 – MC H Macroblock Count..... RW**

7-0 Number of Horizontal Macroblocks

**Port 22A2 – MC V Macroblock Count..... RW**

7-0 Number of Vertical Macroblocks

**Port 22A5-22A4 – MC Frame Buffer Y Length..... RW**

15-0 Number of Pixels in a Y Frame

**Port 22AB-22A8 – Color Palette Entries..... RW**

**Port 22B3-22B0 – SP BUF0 Pixel Start Address ..... RW**

**Port 22B7-22B4 – SP BUF1 Pixel Start Address ..... RW**

**Port 22BB-22B8 – SP BUF0 Command Start AddressRW**

**Port 22BF-22BC – SP BUF1 Command Start AddressRW**

**Port 22C1-22C0 – SP Y Display Offset ..... RW**

**Port 22D0 – Digital TV Encoder Control..... RW**

**Port 22D3-22D1 – Digital TV Encoder CFC..... RW**

### Attribute Controller Registers (AR)

For this indexed register group, the index is accessed at 3C0 as expected. However, although data operations can be performed using port 3C1 in the standard way, data is generally accessed at 3C0 as well. In other words, data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed. The state of the internal flag may be read back in the extended registers (see CR24). To set the internal flag to select the index (i.e., to set the flag so that the next access to port 3C0h points to the index register), read port 3BAh or 3DAh (depending on the state of the color / mono bit in the Miscellaneous Output Register at 3C2[0]). Attribute Controller register data may be read at 3C1 (the internal flag is not toggled) but must be written at 3C0.

#### Port 3C0 – VGA Attribute Controller Index ..... RW

7-6	Reserved	.....always reads 0
5	Palette Address Source	
4-0	Attribute Controller Index	

Only the lower 5 bits are implemented to allow access to Attribute Controller registers 0-14h.

#### Port 3C0/3C1 Index 0-F – Attr Ctrlr Color Palette..... RW

7-6	Reserved	.....always reads 0
5-0	Color Value	

#### Port 3C0/3C1 Index 10 – Attr Ctrlr Mode Control ..... RW

7	P5 / P4 Select	
6	Pixel Width	
5	Pixel Panning Compatibility	
4	Reserved	.....always reads 0
3	Select Background Intensity or Enable Blink	
2	Enable Line Graphics Character Mode	
1	Display Type	
0	Graphics / Text Mode	

#### Port 3C0/3C1 Index 11 – Attr Ctrlr Overscan Color... RW

7-0	Overscan Color	
-----	----------------	--

#### Port 3C0/3C1 Index 12 – Attr Ctrlr Color Plane Ena.. RW

7-6	Reserved	.....always reads 0
5-4	Video Status Mux	
3-0	Color Plane Enable for Color Planes 3-0	

#### Port 3C0/3C1 Index 13 – Attr Ctrlr H Pixel Panning .. RW

7-4	Reserved	.....always reads 0
3-0	Horizontal Pixel Pan	

#### Port 3C0/3C1 Index 14 – Attr Ctrlr Color Select ..... RW

7-4	Reserved	.....always reads 0
3-0	Color Select Bits 7-4	

### VGA Status / Enable Registers

#### Port 3C2 – VGA Input Status 0 ..... RO

7	Vertical Retrace Interrupt Pending	
6-5	Reserved	.....always reads 0
4	Switch Sense	
3-0	Reserved	.....always reads 0

#### Port 3xA – VGA Input Status 1 ..... RO

This register is accessible at either 3BA or 3DA (shorthand notation 3xA) depending on the setting of Miscellaneous Output Register at 3C2[0].

7-6	Reserved	.....always reads 0
5-4	Diagnostic	
3	Vertical Retrace	
2-1	Reserved	.....always reads 0
0	Display Enable (Inverted)	

#### Port 3C2 – VGA Miscellaneous Output Register (Write) WO

#### Port 3CC – VGA Miscellaneous Output Register (Read) RO

7	Vertical Sync Polarity	
6	Horizontal Sync Polarity	
5	Page Bit for Odd / Even	
4	Reserved	.....always reads 0
3-2	Clock Select	
1	Enable RAM	
0	I/O Address Select	
0	CRTC registers at 3Bx, Input Status 1 at 3BA	
1	CRTC registers at 3Dx, Input Status 1 at 3DA	

#### Port 3C3 – VGA Video Subsystem Enable ..... RW

7-1	Reserved	.....always reads 0
0	Video Subsystem Enable	

#### Port 46E8h – VGA Display Adapter Enable..... RW

7-4	Reserved	.....always reads 0
3	Display Adapter Enable	
2-0	Reserved	.....always reads 0

## VGA Sequencer Registers (SR)

### Port 3C4 – VGA Sequencer Index ..... RW

7-0 Sequencer Index  
Only the lower 3 bits are implemented in a standard VGA to point to Sequencer registers 0-4. However, all 8 bits are implemented here to allow for extended registers up to index FF.

### Port 3C5 Index 0 – Sequencer Reset..... RW

7-2 Reserved .....always reads 0  
1 Synchronous Reset  
0 Asynchronous Reset

### Port 3C5 Index 1 – Sequencer Clocking Mode..... RW

7-6 Reserved .....always reads 0  
5 Screen Off  
4 Shift 4  
3 Dot Clock  
2 Shift Load  
1 Reserved .....always reads 0  
0 8/9 Dot Clocks

### Port 3C5 Index 2 – Sequencer Map Mask..... RW

7-4 Reserved .....always reads 0  
3 Enable Map 3  
2 Enable Map 2  
1 Enable Map 1  
0 Enable Map 0

### Port 3C5 Index 3 – Sequencer Character Map SelectRW

7-6 Reserved .....always reads 0  
5 Character Map Select A  
4 Character Map Select B  
3-2 Character Map Select A  
1-0 Character Map Select B

### Port 3C5 Index 4 – Sequencer Memory Mode..... RW

7-4 Reserved .....always reads 0  
3 Chain 4  
2 Odd / Even  
1 Extended Memory  
0 Reserved .....always reads 0

## VGA RAMDAC Registers

### Port 3C6 – VGA RAMDAC Pixel Mask ..... RW

7-0 Palette Address Mask

### Port 3C6 – VGA RAMDAC Command..... RW

This register is a non-standard VGA register ("extension register") located at the same port address as the VGA RAMDAC Pixel Mask register. In order to maintain compatibility with standard VGA operations, access to this register is restricted: access is enabled by performing four successive accesses to the Pixel Mask register at 3C6 (i.e., read 3C6 four times).

7-4 Color Mode Select  
0000 Pseudo-Color Mode .....default  
0001 Hi-Color Mode (15-bit direct interface)  
0010 Muxed Pseudo-Color Mode (16-bit pixel bus)  
0011 XGA Color Mode (16-bit direct interface)  
01xx -reserved-  
10xx -reserved-  
1100 -reserved-  
1101 True Color Mode (24-bit direct interface)  
111x -reserved-  
3 Reserved .....always reads 0  
2 DAC Disable  
0 DAC On (if SR20[0] = 1) .....default  
1 DAC Off  
1 Reserved .....always reads 0  
0 RAMDAC Enable  
0 Disable (Bypass) RAMDAC .....default  
1 Enable RAMDAC

### Port 3C7 – VGA RAMDAC Read Index ..... WO

### Port 3C8 – VGA RAMDAC Write Index ..... WO

### Port 3C8 – VGA RAMDAC Index Readback..... RO

7-0 RAMDAC Index

### Port 3C9 Index 0-FF – RAMDAC Color Palette..... RW

7-0 RAMDAC Color Data

There are 768 data entries in the palette consisting of 256 three-byte entries. R, G, and B 8-bit values are accessed on successive operations to this port with the index autoincremented after every 3 accesses. Refer to a VGA programmers guide for further information.

## VGA Graphics Controller Registers (GR)

### Port 3CE – VGA Graphics Controller Index ..... RW

7	Reserved	.....always reads 0
6-0	Graphics Controller Index	
Only the lower 4 bits are implemented in a standard VGA to allow access to Graphics Controller registers 0-8. However, 7 bits are implemented here to allow for extended registers up to index 7F.		

### Port 3CF Index 0 – Graphics Controller Set / Reset.. RW

7-4	Reserved	.....always reads 0
3-0	Set / Reset Planes 3-0	

### Port 3CF Index 1 – Graphics Controller Set / Reset Enable RW

7-4	Reserved	.....always reads 0
3-0	Enable Set / Reset Planes 3-0	

### Port 3CF Index 2 – Graphics Controller Color Compare RW

7-4	Reserved	.....always reads 0
3-0	Color Compare Planes 3-0	

### Port 3CF Index 3 – Graphics Controller Data Rotate RW

7-4	Reserved	.....always reads 0
3	Function Select	
2-0	Rotate Count	

### Port 3CF Index 4 – Graphics Ctrlr Read Map Select . RW

7-2	Reserved	.....always reads 0
1-0	Map Select	

### Port 3CF Index 5 – Graphics Controller Mode ..... RW

7	Reserved	.....always reads 0
6	256 Color Mode	.....default = 0
5	Shift Register	.....default = 0
4	Odd / Even	.....default = 0
3	Read Mode	.....default = 0
2	Reserved	.....always reads 0
1-0	Write Mode	.....default = 0

### Port 3CF Index 6 – Graphics Controller MiscellaneousRW

7-4	Reserved	.....always reads 0
3-2	Memory Map	
1	Chain Odd Maps to Even	
0	Graphics Mode	

### Port 3CF Index 7 – Graphics Ctrlr Color Don't Care . RW

7-4	Reserved	.....always reads 0
3-0	Color Don't Care Planes 3-0	

### Port 3CF Index 8 – Graphics Controller Bit Mask ..... RW

7-0	Bit Mask	
-----	----------	--

## VGA CRT Controller Registers (CR)

CRTC registers are accessible at either 3B4 / 3B5 or 3D4 / 3D5 (shorthand notation 3x4 / 3x5) depending on the setting of Miscellaneous Output Register 3C2 bit-0

### Port 3x4 – VGA CRT Controller Index ..... RW

#### 7-0 CRT Controller Index

Only the lower 5 bits are implemented in a standard VGA to allow access to CRTC registers 0-18h. However, all 8 bits are implemented here to allow for extended registers up to index FF.

### Port 3x5 Index 0 – VGA CRTC – H Total..... RW

#### 7-0 Horizontal Total

### Port 3x5 Index 1 – VGA CRTC – H Display Ena End. RW

#### 7-0 Horizontal Display Enable End

### Port 3x5 Index 2 – VGA CRTC – H Blank Start..... RW

#### 7-0 Horizontal Blanking Start

### Port 3x5 Index 3 – VGA CRTC – H Blank End ..... RW

- 7 Reserved .....always reads 0
- 6-5 Display Enable Skew
- 4-0 Horizontal Blanking End

### Port 3x5 Index 4 – VGA CRTC – H Retrace Start..... RW

#### 7-0 Horizontal Retrace Pulse Start

### Port 3x5 Index 5 – VGA CRTC – H Retrace End..... RW

- 7 Horizontal Blanking End
- 6-5 Horizontal Retrace Delay
- 4-0 Horizontal Retrace Pulse End

### Port 3x5 Index 6 – VGA CRTC – V Total ..... RW

#### 7-0 Vertical Total ..... default = 0

### Port 3x5 Index 7 – VGA CRTC – Overflow..... RW

- 7 Vertical Retrace Start Bit-9
- 6 Vertical Display Enable End Bit-9
- 5 Vertical Total Bit-9
- 4 Line Compare Bit-8
- 3 Vertical Blank Start Bit-8
- 2 Vertical Retrace Start Bit-8
- 1 Vertical Display Enable End Bit-8
- 0 Vertical Total Bit-8

### Port 3x5 Index 8 – VGA CRTC – Preset Row Scan.... RW

- 7 Reserved .....always reads 0
- 6-5 Byte Panning
- 4-0 Preset Row Scan

### Port 3x5 Index 9 – VGA CRTC – Max Scan Line..... RW

- 7 200 to 400 Line Conversion
- 6 Line Compare Bit-9
- 5 Vertical Blank Start Bit-9
- 4-0 Maximum Scan Line

### Port 3x5 Index A – VGA CRTC – Cursor Start..... RW

- 7-6 Reserved .....always reads 0
- 5 Cursor On/Off
- 4-0 Cursor Row Scan Start

### Port 3x5 Index B – VGA CRTC – Cursor End..... RW

- 7 Reserved .....always reads 0

#### 6-5 Cursor Skew

#### 4-0 Cursor Row Scan End

### Port 3x5 Index C / D – VGA CRTC Start Addr Hi/Lo .. RW

### Port 3x5 Index E / F – VGA CRTC Cursor Loc Hi/Lo . RW

### Port 3x5 Index 10 – VGA CRTC – V Retrace Start..... RW

#### 7-0 Vertical Retrace Pulse Start

### Port 3x5 Index 11 – VGA CRTC – V Retrace End ..... RW

- 7 CR0-7 Write Protect
- 6 Reserved .....always reads 0
- 5 Vertical Interrupt Enable
- 4 Vertical Interrupt Clear
- 3-0 Vertical Retrace Pulse End

### Port 3x5 Index 12 – VGA CRTC – V Display Ena End RW

#### 7-0 Vertical Display Enable End

### Port 3x5 Index 13 – VGA CRTC – Offset..... RW

#### 7-0 Display Screen Logical Line Width

### Port 3x5 Index 14 – VGA CRTC – Underline LocationRW

- 7 Reserved .....always reads 0
- 6 Double Word Mode
- 5 Count By 4
- 4-0 Underline Location

### Port 3x5 Index 15 – VGA CRTC – V Blank Start ..... RW

#### 7-0 Vertical Blanking Start

### Port 3x5 Index 16 – VGA CRTC – V Blank End ..... RW

#### 7-0 Vertical Blanking End

### Port 3x5 Index 17 – VGA CRTC – Mode Control ..... RW

- 7 Hardware Rese
- 6 Word / Byte Mode
- 5 Address Wrap
- 4 VSYNC Update Select (VGA Extended Capability)
  - 0 Base may only be updated during Vsync.... def
  - 1 Base address may be updated during Hsync
- 3 Count By 2 .....default = 0
- 2 Horizontal Retrace Select .....default = 0
- 1 Select Row Scan Counter .....default = 0
- 0 Compatibility Mode Support.....default = 0

### Port 3x5 Index 18 – VGA CRTC – Line Compare..... RW

#### 7-0 Line Compare

## Extended Registers – Non-Indexed I/O Ports

### Port 3D8 – Alternate Destination Segment Addr ..... RW

7      **Reserved** .....always reads 0  
6-0      **Alternative Destination Segment Address**def = 00

Read / write of this register is enabled by GRF[2].

This register becomes active when GR6[3-2] are not 00.

### Port 3D9 – Alternate Source Segment Address..... RW

7      **Reserved** .....always reads 0  
6-0      **Alternative Source Segment Address** ...def = 00

Read / write of this register is enabled by GRF[2].

This register becomes active when GR6[3-2] are not 00.

### Port 3xB – Alternate Clock Select..... RW

3xB notation indicates that this register is accessible at either 3BB or 3DB depending on the setting of the color / mono bit.

7-5      **New Mode Control Register Bits 3-1** ..... def = 00  
These bits have the same function as SRD[3-1]

4-2      **Reserved** .....always reads 0

1-0      **Video Clock Select**..... def = 00

## Extended Registers – VGA Sequencer Indexed

### SR8 – Old / New StatusRO

7	<b>Old / New Status</b> (see SRB, SRC, SRD, SRE, GRE)
0	Old ..... default
1	New
6	<b>Interlace Scan Field</b>
0	Odd ..... default
1	Even
5	<b>Reserved</b> ..... always reads 0
4	<b>Command FIFO Empty</b>
0	Empty ..... default
1	Not Empty
3-0	<b>Reserved</b> ..... always reads 0

### SR9 – Graphics Controller Version.....RO

7-0	<b>Version Number</b> ..... always reads 58h
-----	--

### SRB – Version / Old-New Mode Control.....RW

7-0	<b>Graphics Controller Version #</b> .always reads F3h
-----	--

A write to this register will change the Old / New Mode Control registers (SRD, SRE, and GRE) to the "old" definition. A read from this register will change the Old / New Mode Control registers to the "new" definition.

### SRC – Configuration Port 1.....RW

Access to this register is enabled by SRE\_Old[5] = 1 ("Select Configuration Port 1") and writes are enabled by SRE\_New[7] = 1 ("Configuration Port Write Enable").

7	<b>Reserved</b> ..... always reads 1
6	<b>Memory Bus Width</b>
0	32-bit Memory Bus..... default
1	64-bit Memory Bus

Note: Although the CyberBlade i7 integrated graphics controller does not control memory directly (the system memory controller is used to access graphics memory as a portion of system memory), some functional blocks in the graphics controller (such as video) use this bit to manage their data bus widths.

5	<b>Reserved</b> ..... always reads 1
4	<b>Video Subsystem Enable</b>
0	46E8
1	3C3 ..... default
3	<b>Video BIOS Size</b>
0	64K ..... default
1	32K
2-0	<b>Reserved</b> ..... always reads 111b

### SRC – Configuration Port 2.....RW

Access to this register is enabled by SRE\_Old[5] = 0 ("Select Configuration Port 2") and writes are enabled by SRE\_New[7] = 1 ("Configuration Port Write Enable").

7-0	<b>Reserved for BIOS</b>
-----	--------------------------

### SRD – Mode Control 2 (Old).....RW

7-6	<b>Reserved</b> ..... always reads 0
5	<b>Reserved</b> ..... always reads 1
4	<b>Reserved</b> ..... always reads 0
3	<b>CPU Bandwidth Select</b>
0	Normal ..... default
1	Non-interrupted CPU access during VBLANK
2-0	<b>Reserved</b> ..... always reads 0

### SRD – Mode Control 2 (New).....RW

7-4	<b>Display FIFO Memory Request Threshold Ctrl</b>
0000	Empty 0 level
0001	Empty 4 level ..... default
0010	Empty 8 level
0011	Empty 12 level
0100	Empty 16 level
0101	Empty 20 level
0110	Empty 24 level
0111	Empty 28 level
1000	Empty 32 level
1001	Empty 36 level
1010	Empty 40 level
1011	Empty 44 level
1100	Empty 48 level
1101	Empty 52 level
1110	Empty 56 level
1111	Empty 60 level
3	<b>Reserved</b> ..... always reads 0
2-1	<b>Video Clock Divide</b>
00	Divide by 1 ..... default
01	Divide by 2
10	Divide by 4
11	Divide by 1.5
0	<b>Reserved</b> ..... always reads 0

### SRE – Mode Control 1 (Old) ..... RW

7	Reserved	always reads 1
6	IRQ Polarity Select	
	0 Active High	default
	1 Active Low	
5	Configuration Port (SR0C) Select	
	0 Select Port 2	
	1 Select Port 1	default
4	Reserved	always reads 0
3	Memory Bus	RO
	0 8-bit	
	1 16-bit	always reads 1
2-1	256K Bank Select	
	00 Bank 0	default
	01 Bank 1	
	10 Bank 2	
	11 Bank 3	

Note: an inverted value will be written to bit-1

These bits (and 3C2[5]) are write enabled when GR06[3-2] = 00. 3C2[5] is used as a page select to select one of the two 64KB pages.

0	RAMDAC Pixel Clock Invert	
	0 Normal	default
	1 Invert pixel clock to RAMDAC	

### SRE – Mode Control 1 (New) ..... RW

7	Configuration Port Write Enable	default = 0
	0 Write Protect	
	1 Write Enable	
6	Reserved	

Ports effected: SRC, SRF, CR28-2A, SRE\_New[6-4] (this register), and SR10[0]

5-0	64K Bank Select	default = 0
-----	-----------------	-------------

Bit-1 should be inverted when performing writes

These bits are enabled when GR06[3-2] are written with any value other than 00.

### SRF – Power-up Mode 2 ..... RW

This register is write protected by SRE\_New[7].

7	Reserved	always reads 1
6	BIOS Control	
	0 Disabled	default
	1 Enabled	
5	Palette Mode	
	0 Master Abort Mode	
	1 Intel Retry Mode	default
4	Linear / Bank Addressing Control	
	0 Linear Only	
	1 Linear / Bank	default
3-0	Reserved for BIOS	default = 1111

### SR10 – VESA™ Big BIOS Control ..... RW

7	Extended VESA™ Big BIOS Enable	
	0 Disabled	default
	1 Enabled	
6-5	Video Address Select	RO
	00 A0000-A7FFF	default
	01 -reserved-	
	10 B0000-B7FFF	
	11 B8000-BFFFF	

These bits are decoded from GR6[3-2]

4-1	Reserved	always reads 0
0	Page Select	

	0 Select the original C0000-C7FFF access ... def	
	1 Select extended access defined by bits 6-5	

Bit-0 of this register is write protected by SRE\_New[7].

### SR11 – Protection ..... RW

7-0	Register Protection Enable	default = 00
	87 Unprotect all extended registers except those which may still be protected by SRE_New[7]	
	92 Unprotect all extended registers independent of SRE_New[7]	

If any value other than the ones listed above is programmed into this register, all extended registers will be write protected.

### SR12 – Threshold ..... RW

7-4	Queue Threshold Playback <u>and</u> Capture	def = 2
	Threshold of the display queue when both playback and capture are enabled (for definition see SRD.new).	
3-0	Queue Threshold Playback <u>or</u> Capture	def = 1
	Threshold of the display queue when either playback or capture are enabled (for definition see SRD.new)	

The old threshold is used when neither playback nor capture is enabled. All three thresholds cannot be set to 0. Other definitions are the same as the original.

## Graphics Clock Synthesizer Control

### SR18 – VCLK1 Frequency Control 0 ..... RW

7-0 VCLK1 Frequency Generator Numerator...def=0

### SR19 – VCLK1 Frequency Control 1 ..... RW

7-6 VCLK1 Frequency Generator K-Factor.....def=0

5-0 VCLK1 Frequency Generator Denominatordef=0

### SR1A – VCLK2 Frequency Control 0..... RW

7-0 VCLK2 Frequency Generator Numerator...def=0

### SR1B – VCLK2 Frequency Control 1..... RW

7-6 VCLK2 Frequency Generator K-Factor.....def=0

5-0 VCLK2 Frequency Generator Denominatordef=0

### SR20 – Clock Synthesizer / RAMDAC Setup..... RW

7 Reserved .....always reads 0

#### 6 **Multiplex Mode Sync Mechanism**

0 Normal Mode .....default

1 Enable synchronization in multiplexed mode for high VCLK tracking

#### 5 **Simultaneous VAFC and Playback**

0 Simultaneous VAFC / playback display .default

1 Playback only

#### 4 **VAFC and Playback Display Overlay**

0 VAFC is on top.....default

1 Playback is on top

#### 3 **DAC Test Mode**

0 Disable.....default

1 Enable

#### 2 **Video Mode**

0 Disable.....default

1 Enable

#### 1-0 **Video Mode Select**

x0 5-5-5 Hi-color .....default = 0

x1 5-6-5 XGA-color

0x Video Playback, True-color

1x Video Playback, 256-color

Table 8-6. Graphics Clock Frequencies – 14.31818 MHz Reference

<u>Denominator Value</u>	<u>Numerator Value</u>	<u>N</u>	<u>M</u>	<u>K</u>	<u>Actual Frequency</u>	<u>Expected Frequency</u>	<u>Frequency Error %</u>
88	3E	62	8	2	25.057	25.175	-0.0047

4A	AD	163	10	1	108.182	108.000	0.0017
02	19	25	2	0	118.125	118.000	0.0011
03	22	34	3	0	120.273	120.000	0.0023
05	3A	58	5	0	135.000	135.000	0.0000
05	4B	75	5	0	169.773	170.000	-0.0013
05	5A	90	5	0	200.455	200.000	0.0023

Note: The clock frequency can be derived by multiplying the reference frequency times  $(N+8) / [(M+2) \times 2^K]$

## Graphics Signature Analyzer Registers

### SR21 – Signature Control..... RW

- 7     **Signature Generator Enable**
  - 0     Disable (readback 0 indicates done)..... default
  - 1     Enable (readback 1 indicates busy)
- 6     **Signature Source Select**
  - 0     TV / CRT ..... default
  - 1     LCD
- 5-0   **Bit Select** ..... default = 0

### SR23-22 – Signature Data..... RO

- 15-0   **Signature Data**

## Graphics Power Management Control Registers

### SR24 – Power Management Control ..... RW

- 7     **RAMDAC Clock During RAMDAC Powerdown**
  - 0     14.318 MHz ..... default
  - 1     14.31818 MHz divided by 2
- 6     **Enable VCLK2 VCO Directly**  
(without warmup sequence)
  - 0     Enable
  - 1     Don't Enable..... default
- 5-4   **Clock Input Divisor**  
Divisor for 14.318 MHz clock input to MCLK to drive DRAM refresh cycles in power managed modes.
  - 00 1 ..... default
  - 01 2
  - 10 4
  - 11 8
- 3     **Power Management Slow MCLK**
  - 0     Use divided MCLK during standby & suspend
  - 1     Use MCLK during standby & suspend ..... def
- 2     **Enable MCLK VCO Directly**  
(without warmup sequence)
  - 0     Enable
  - 1     Don't Enable..... default
- 1     **Enable MCLK VCO Directly**  
(without warmup sequence)
  - 0     Enable
  - 1     Don't Enable..... default
- 0     **DAC Power**
  - 0     Off ..... default
  - 1     On

## Graphics Connector Control Registers

### SR25 – Monitor Sense RO

- 7-3   **Reserved** ..... always reads 0
- 2-0   **Monitor Sense Result: [red, green, blue]**

### SR37 – Video Key Mode ..... RW

- 7     **Feature Connector Input Clock Polarity**
  - 0     Normal.....default
  - 1     Inverted
- 6     **Signal Output (AFC Processing)**
  - 0     Signal output is sent before AFC processingdef
  - 1     Signal output is sent after AFC processing
- 5-4   **Feature Connector Input Pixel Clock Tuning**
  - 00 0 ns .....default
  - 01 4 ns
  - 10 8 ns
  - 11 12 ns delay of pixel clock with respect to data
- 3-0   **Overlay Key Type**
  - 0000 VGA Port Only .....default
  - 0001 Color Key & Video Key
  - 0010 Color Key & not Video Key
  - 0011 Color Key
  - 0100 Not Color Key & Video Key
  - 0101 Video Key
  - 0110 Color Key XOR Video Key
  - 0111 Color Key | Video Key
  - 1000 Not Color Key & Not Video Key
  - 1001 Color Key XNOR Video Key
  - 1010 Not Video Key
  - 1011 Color Key | Not Video Key
  - 1100 Not Color Key
  - 1101 Not Color Key | Video Key
  - 1110 Not Color Key | Not Video Key
  - 1111 Video Port Only

### SR38 – Advanced Feature Connector (AFC) Control RW

- 7     **Reserved** ..... always reads 0
- 6     **DCLK Rate** (set after other bits for synchronization)
  - 0     PCLK.....default
  - 1     PCLK / 2
- 5     **DCLK Phase Select** (if bit-6 = 1)
  - 0     180 degree phase shift.....default
  - 1     In phase
- 4     **DCLK Output Polarity**
  - 0     Normal when bit-6 = 0 .....default
  - 1     Inverted
- 3     **VCLK Input Polarity**
  - 0     Normal.....default
  - 1     Inverted
- 2-1   **Reserved** ..... always reads 0
- 0     **Pixel Data Bus Output Enable Control**
  - 0     Disable Output Drive .....default
  - 1     Disable drive only when EVIDEO# is low

#### Graphics Playback Control Registers

##### SR52-50 – Playback Color Key Data ..... RW

23-16	Playback Color Key for True Color Mode
15-8	Playback Color Key for High Color Mode
7-0	Playback Color Key for 256 Color Mode

##### SR56-54 – Playback Color Key Mask ..... RW

23-16	Playback Color Key Mask for True Color Mode
15-8	Playback Color Key Mask for High Color Mode
7-0	Playback Color Key Mask for 256 Color Mode

##### SR57 – Playback Video Key Mode Function ..... RW

###### 7-0 Overlay Key Type

Defines all 256 different types of mixing among VGA Color Key, Playback Window Key, and Video Chroma Key (very similar to ROP3 code). Below are some common combinations:

00	VGA Port Only
F0	Color Key Only
CC	Playback Key Only
AA	Chroma Key Only
88	Playback Key & Chroma Key
C0	Color Key & Playback Key
80	Color Key & Playback Key & Chroma Key
FF	Video Port Only

#### Graphics Second Playback Control Registers

##### SR62-60 – 2<sup>nd</sup> Playback Color Key Data ..... RW

23-16	Playback Color Key for True Color Mode
15-8	Playback Color Key for High Color Mode
7-0	Playback Color Key for 256 Color Mode

##### SR66-64 – 2<sup>nd</sup> Playback Color Key Mask ..... RW

23-16	Playback Color Key Mask for True Color Mode
15-8	Playback Color Key Mask for High Color Mode
7-0	Playback Color Key Mask for 256 Color Mode

#### Graphics BIOS Scratch Pad Registers

##### SR5A – Scratch Pad 0 RW

##### SR5B – Scratch Pad 1 RW

##### SR5C – Scratch Pad 2 RW

##### SR5D – Scratch Pad 3 RW

##### SR5E – Scratch Pad 4 RW

##### SR5F – Scratch Pad 5 RW

## Graphics Video Display Registers

### SR82-80 – Window 1 U-Plane FB Start Address ..... RW

23-20 Reserved .....always reads 0

19-0 W1 U-Plane FB Start Address

When operating in planar mode, this field defines the frame buffer starting address for the U-plane for the first live video window

### SR85-83 – Window 1 V-Plane FB Start Address ..... RW

23-20 Reserved .....always reads 0

19-0 W1 V-Plane FB Start Address

When operating in planar mode, this field defines the frame buffer starting address for the V-plane for the first live video window

### SR88-86 – Window 2 Frame Buffer Start Address .... RW

23-20 Reserved .....always reads 0

19-0 Window 2 Frame Buffer Start Address

Frame buffer starting address for the second live video window (packed YUV format only)

### SR8A-89 – Window 2 Horizontal Scaling Factor ..... RW

15 W2 Horizontal Minify / Zoom Select

0 Zoom..... default

1 Minify

#### Zoom Selected (Bit-15 = 0)

14 Reserved

13-0 W2 Horizontal Zoom Factor

Same format as for the first live video window as defined in CR80 and CR81

#### Minify Selected (Bit-15 = 1)

14-13 W2 Tap

12-10 W2 Horizontal Minify Integer (Inverter)

9-0 W2 Horizontal Minify Factor

### SR8C-8B – Window 2 Vertical Scaling Factor ..... RW

15 W2 Vertical Minify / Zoom Select

0 Zoom.....default

1 Minify

14 W2 Vertical Filtering

0 Off .....default

1 On

#### Zoom Selected (Bit-15 = 0)

13-0 W2 Vertical Zoom Factor

Same format as for the first live video window as defined in CR82 and CR83

#### Minify Selected (Bit-15 = 1)

13-10 Reserved

9-0 W2 Vertical Minify Factor

### SR90-8D – Window 2 Live Video Start ..... RW

31-28 Reserved ..... always reads 0

27-16 W2 Vertical Starting Point

15-12 Reserved ..... always reads 0

11-0 W2 Horizontal Starting Point

### SR94-91 – Window 2 Live Video End ..... RW

31-30 W2 Line Buffer Level Bits 8-7 (see SR95)

29-28 Reserved ..... always reads 0

27-16 W2 Vertical Ending Point

15-12 Reserved ..... always reads 0

11-0 W2 Horizontal Ending Point

### SR95 – Window 2 Live Video Line Buffer Level ..... RW

7 Reserved ..... always reads 0

6-0 W2 Line Buffer Level Bits 6-0 (see SR91[31-30])

### SR96 – New Live Video Window Control 0..... RW

7	<b>W2 Horizontal Interpolation</b>
0	Interpolation ..... default
1	Duplication
6	<b>W1 Vertical Interpolation U and V Components</b>
0	Enable..... default
1	Disable
This bit is effective only if window 1 vertical Y interpolation is enabled (CR8E[12] = 1)	
5	<b>Reserved</b> .....always reads 0
4	<b>656</b>
0	Disable..... default
1	Enable
3	<b>W2 Color Space Converter (CSC) Bypass</b>
0	Disable..... default
1	Enable
2	<b>Reserved</b> .....always reads 0
1	<b>MC Even / Odd Inverter</b>
0	Disable..... default
1	Enable
0	<b>MC Interlace Display</b>
0	Disable..... default
1	Enable

### SR97 – New Live Video Window Control 1..... RW

7	<b>Reserved</b> .....always reads 0
6	<b>Planar Mode X (Horizontal) Y/UV Ratio</b>
0	2x ..... default
1	4x
5-4	<b>Planar Mode Y (Vertical) Y/UV Ratio</b>
00	2x (Yp420)..... default
01	4x (Yp410)
1x	1x (Yp422)
3	<b>Reserved</b> .....always reads 0
2-0	<b>Window Mode</b> .....default = 000b
	Format                      InterpolationLine Buffers
000	YUV422                      H-V .... (96+48) x 64
001	Planar                      H-V .... (96+48) x 64
01x	YUV                      FIFO H ..... 96 x 64
100	MPEG2 YUV422                      H-V ...2x(96+48)x64
101	MPEG2 Planar                      H-V ...2x(96+48)x64
11x	YUV422                      H-V (V-YUV)                      2x(96+48)x64

For 1xx, only one h/w overlay window is supported

### SR98 – New Live Video Window Control 2 ..... RW

7-6	<b>Two Live Window Chroma Key Select</b>
00	Chroma key only .....default
01	Window 1 & chroma key
10	Window 2 & chroma key
11	(Window 1   Window 2) & chroma key
5-4	<b>W1 Anti-Flicker Removal</b>
00	Disable .....default
01	One field is shifted up 1 line
10	One field is shifted up 2 lines
11	One field is shifted up 3 lines
3	<b>W1 Anti-Flicker Removal Field Selection</b>
0	Odd field is shifted up..... default
1	Even field is shifted up
2-1	<b>W2 Anti-Flicker Removal</b>
00	Disable .....default
01	One field is shifted up 1 line
10	One field is shifted up 2 lines
11	One field is shifted up 3 lines
0	<b>W2 Anti-Flicker Removal Field Selection</b>
0	Odd field is shifted up..... default
1	Even field is shifted up

### SR99 – New Live Video Window Control 3 ..... RW

7	<b>Reserved</b> .....always reads 0
6	<b>Capture Address Swap Enable</b>
0	Disable .....default
1	Enable
5	<b>Capture Address Swap</b>
0	No swap .....default
1	Swap
4-2	<b>W2 HDE Delay Adjust</b> ..... default = 0
1-0	<b>Reserved</b> ..... always reads 0

### SR9B-9A – Window 1 UV Video Row Byte Offset ..... RW

15-14	<b>Reserved</b> ..... always reads 0
13-0	<b>W1 UV Plane Video Row Byte Offset</b> (the bytes in a row)

### SR9D-9C – Window 2 Y Video Row Byte Offset..... RW

15-14	<b>Reserved</b> ..... always reads 0
13-0	<b>W2 Y Plane Video Row Byte Offset</b> (the bytes in a row)

### SR9E – Line Buffer Request Threshold ..... RW

7	<b>Reserved</b> ..... always reads 0
6-0	<b>Line Buffer Request Threshold Level</b> ..... def = 0

**SR9F – VBI Control RW**

7	VBI Interrupt Status.....	RO
6	Reserved .....	always reads 0
5	VBI Bit-8	
4	VBI IV Bit-8	
3	VBI Interrupt	
	0 Disable.....	default
	1 Enable	
2	VBI Enable	
	0 Disable.....	default
	1 Enable	
1-0	VBI Data Format in Frame Buffer	
	00 Every field data overwrite.....	default
	01 Data in even/odd format	
	10 Every two field data write contiguous	
	11 -reserved-	

**SRAD-AC – VBI Vertical Interrupt Position..... RW**

15	Reserved .....	always reads 0
14-12	Dithering Mode	
	000 Bypass dithering.....	default
	001 -reserved-	
	010 24 bpp dither to 16 bpp	
	011 24 bpp chop to 16 bpp	
	100 24 bpp dither to 15 bpp

## Extended Registers – VGA Graphics Controller Indexed

### GRE – Old Source Segment Address..... RW

7-3	Reserved .....	always reads 0
2-1	Source Segment Address Select .....	default = 0
0	Reserved .....	always reads 0

### GRE – New Source Segment Address ..... RW

7	Reserved .....	always reads 0
6-0	Source Segment Address Select .....	default = 0

Bit-1 is written inverted

### GRF – Miscellaneous Extended Function Control.... RW

7	Reserved .....	always reads 0
6	Character Clock Division Control Bit-1 (see bit-3)	
	00 No division .....	default
	01 Divide by 2 .....	
	10 Divide by 3 .....	
	11 -reserved-	
5	Symmetric / Asymmetric DRAM Address	
	0 Symmetric.....	default
	1 Asymmetric .....	
4	Compressed Chain 4 Mode for CPU Path	
	0 Disable .....	default
	1 Enable .....	
3	Character Clock Division Control Bit-0 (see bit-6)	
2	Alternate Bank & Clock Select	
	0 Disable 3D8, 3D9, and 3xB .....	default
	1 Enable 3D8, 3D9, and 3xB .....	
1	Compressed Chain 4 Mode Display Path	
	0 Disable .....	default
	1 Enable .....	
0	Source Segment Address Register Enable	
	0 Disable GRE.....	default
	1 Enable GRE .....	

All bits except 2 and 0 are write protected by SRE\_New[7]

### Power Management Registers

#### GR20 – Standby Timer Control ..... RW

- 7     **Timer Initialize & Enable**
  - 0   Enable Timer ..... default
  - 1   Initialize and hold standby and DPMS timer
- 6-4   **Timer Testing** ..... RO
- 3-0   **Reserved** ..... always reads 0

#### GR21 – Power Management Control 1 ..... RW

- 7     **Power Management Pin Polarity**
  - 0   Active High ..... default
  - 1   Active Low
- 6     **PCI Power Management**
  - 0   Disable ..... default
  - 1   Enable
- 5     **Suspend Mode**
  - 0   Normal mode ..... default
  - 1   Enter Suspend Mode
- 4     **Suspend Input Pin**
  - 0   Disable ..... default
  - 1   Enable
- 3     **D3 to D0 Reset**
  - 0   Disable ..... default
  - 1   Enable
- 2     **Standby Input Pin**
  - 0   Disable ..... default
  - 1   Enable
- 1     **CLKRUN# Mechanism**
  - 0   Disable ..... default
  - 1   Enable
- 0     **Consistent Standby / Suspend**
  - 0   The bits in the PCI PM configuration registers will be OR'ed with bits 5 and 3 of this register for connection to the internal PM state machine default
  - 1   The bits in the PCI PM configuration registers will be the same as bits 5 and 3 of this register to allow software coherency

#### GR22 – Power Management Control 2 ..... RW

- 7     **Timer Test Mode**
  - 0   Disable ..... default
  - 1   Enable
- 6     **Refresh Clock Select**
  - 0   Crystal input or external clock (XMCLK) provides refresh clock during suspend .. default
  - 1   REFCLK is used as refresh clock during suspend for 64ms refresh (ignore "Suspend DRAM Refresh Mode" bits 5-4 below)
- 5-4   **Suspend DRAM Refresh Mode**
  - 00   No refresh ..... default
  - 01   Self refresh
  - 10   Crystal clock provides rate for 8ms refresh
  - 11   Crystal clock provides rate for 64ms refresh
- 3     **Disable GPIO**
  - 0   Allow GPIO 7-0 pins to drive data in ..... default
  - 1   Disable GPIO 7-0 pins (and their shared functions) from driving data. Tristates input buffers on pins so no power is consumed if GPIO pins are set to input mode.
- 2     **Reserved** ..... always reads 0
- 1     **Hardware / Software Oscillator Select**
  - 0   Software controls oscillator off with bit-0 (prevents automatic oscillator shutdown without direct software control of the "Oscillator Disable" bit) def
  - 1   Hardware controls oscillator off (allow oscillator shutdown when power states are entered using hardware mechanisms)
- 0     **Oscillator Disable**
  - 0   Enable normal function ..... default
  - 1   Disable (oscillator off)

## GR23 – Power Status RW

7	<b>Power Management Pin Polarity</b> (see GR21[7])
6-5	<b>Chip Power Status</b>
	00 Ready
	01 Standby
	10 Suspend
	11 -reserved-
4	<b>LCD Power Sequence Status</b>
	0 LCD power sequencing is not occurring at this time
	1 LCD power sequencing is occurring at this time
3-2	<b>Panel Power Sequencing</b>
	00 Fast panel power sequencing..... default
	01 -reserved-
	10 -reserved-
	11 Slow panel power sequencing
1-0	<b>DPMS Power Status</b>
	00 On Mode (CRT interface is active and RAMDAC is full on)..... default
	01 Standby Mode (Hsync disabled, Vsync active, DAC off, RAMDAC color palette lookup table (LUT) video data path is off but LUT I/O is allowed)
	10 Suspend Mode (Vsync disabled, Hsync active, RAMDAC is off but contents are retained)
	11 Off Mode (Hsync and Vsync disabled, DAC LUT is full off)

In hardware mode, these bits indicate the status of CRT Hsync and Vsync as well as the internal RAMDAC power state (the "off" mode state can be read only in CRT only mode). In software mode, these bits control the state of the CRT Hsync and Vsync signals but not the power state of the internal RAMDAC. In simultaneous display modes, the power state of the RAMDAC is not controlled by the DPMS Power State (bits 1-0), but by the Chip Power State (bits 6-5).

## GR24 – Software Power Control ..... RW

7	<b>VCLK</b>
	0 Disable
	1 Enable.....default
6	<b>MCLK</b>
	0 Disable
	1 Enable.....default
5	<b>CPU &amp; DRAM Data Bus</b>
	0 Disable
	1 Enable.....default
4	<b>Reserved</b> .....
	always reads 0
3	<b>ENPBLT (Panel and/or Backlight Enable) Control</b>
	<u>Software Power Control</u>
	0 Drive ENPBLT Low .....default
	1 Drive ENPBLT High
	<u>Hardware Power Control</u> (timers, pin, register bit)
	0 ENPBLT is active low.....default
	1 ENPBLT is active high
2	<b>Panel VDD</b>
	0 Disable .....default
	1 Enable
1	<b>Panel Interface Signals</b>
	0 Disable .....default
	1 Enable
0	<b>Panel VEE</b>
	0 Disable .....default
	1 Enable

## GR25 – Power Control Select..... RW

When any of bits 7-6 or 3-0 are set to 1, the corresponding power control bit reads back the logic state of the internal power management engine. For all bits below, 0 selects hardware power control and 1 selects software power control.

7	<b>Power Control for VCLK</b> ..... def = 1
6	<b>Power Control for MCLK</b> ..... def = 1
5	<b>Power Control for the Data Bus</b> ..... def = 1
4	<b>Power Control for the RAMDAC</b> ..... def = 1
	The RAMDAC is software enabled in GR26[7-6]
3	<b>Power Control for Panel Enable / Backlight</b> def = 1
1	(see GR24[3])
2	<b>Power Control for Panel VDD</b> ..... def = 1
1	<b>Power Control for Panel Interface Signals</b> def = 1
0	<b>Power Control for Panel VEE</b> ..... def = 1

### GR26 – DPMS Control RW

- 7-6 **RAMDAC Internal Power Control**
- 00 Normal ..... default
  - 01 DAC off (used in LCD only mode)
  - 10 Standby (DAC off, LUT in low power mode, I/O allowed to LUT). May be used in LUT bypass mode.
  - 11 Suspend (DAC off, LUT access disallowed but LUT contents are preserved)
- 5-4 **Reserved** .....always reads 0
- 3 **DPMS Control**
- 0 Software Control Mode: DPMS controlled by GR23[1-0] in simultaneous display and CRT-only modes (may be used to decouple the power modes of the CRT and LCD during simultaneous display) ..... default
  - 1 Hardware Control Mode: DPMS controlled by internal power states.
- 2-0 **Reserved** .....always reads 0

### DPMS Control Modes

#### *DPMS Software Control Mode*

In simultaneous display mode, the software control mode can be used to control DPMS low power states independent of the chip power states. In CRT display mode, software mode gives total DPMS control to software. Pseudo-standby may be controlled by bits 7 and 6, as well as BLANK# timing.

#### *DPMS Hardware Control Mode*

**Table8-7. DPMS Sequence - Hardware Timer Mode**

Power Level	DPMS Mode
High - Activity detected	On
Moderate - 16 min inactivity	Standby
Low - 32 min inactivity	Suspend
Lowest - 64 min inactivity	Off

DPMS hardware timer mode is defined as CRT only mode with the DPMS control mode bit set to hardware (bit 3 =1). Activity detection is set by register GR21[2:0]. Status is indicated in bits 1 and 0. The timer may be controlled by software from GR20[7].

**Table 8-8. DPMS Sequence - Hardware Mode in Simultaneous Display Mode**

Power Level	DPMS Mode
High - Chip on state	On
Moderate - Chip standby	Off
Low - Chip suspend	Off
Lowest - Chip off state	Off
In simultaneous display mode with hardware DPMS set, DPMS states are sequenced by the timer, pin, and register bits that control the chip power states.	

**GR28-27 – GPIO Control..... RW**

15-8	GPIO Direction 7-0	
0	Read	default
1	Write	
7-0	GPIO Data 7-0	default = 0

**CR3C – Miscellaneous Control ..... RW**

7-3	<b>Same Definition as GRF[7-3]</b> ..... default = 0
2	<b>Reserved</b> ..... always reads 0
1	<b>Same Definition as GRF[1]</b> ..... default = 0
0	<b>Mode Select 1</b> ..... default = 0
	0 This register has no function ..... default
	The original GRF[7-0] bits are used
	1 GRF[7-3, 1] accessed via this register only
	GRF[2, 0] accessed at original register only
	Original GRF[3] is R/W but has no function

This register is protected by SRE\_New[7]

### Hardware Cursor Registers

The CyberBlade i7 supports a Windows® compatible hardware cursor. The hardware cursor operates only in extended planar and packed pixel modes. The cursor size can be selected between 32x32 and 64x64. Two 2-bits-per-pixel images define the cursor shape. The table below shows how these two bits operate on each pixel. The hardware cursor pattern is stored in off-screen memory.

**Table 8-9. Hardware Cursor Pixel Operation**

Plane 0 (AND)	Plane 1 (XOR)	Pixel Operation (Windows®)	Pixel Operation (X11)
1	0	Transparent	Cursor BG Color
1	1	VGA Data Inversion	Cursor FG Color
0	1	Cursor FG Color	Transparent
0	0	Cursor BG Color	Transparent

### CR43-40 – Hardware Cursor Position ..... RW

31-28    Reserved .....always reads 0  
27-16    Hardware Cursor Position Y Dimension  
15-12    Reserved .....always reads 0  
11-0     Hardware Cursor Position X Dimension

### CR45-44 – Hardware Cursor Pattern Location ..... RW

15-12    Reserved .....always reads 0  
11-0     Hardware Cursor Map Mask Storage Location  
          1KB aligned in the frame buffer

### CR47-46 – Hardware Cursor Offset ..... RW

15       Reserved .....always reads 0  
14-8     Hardware Cursor Position Y-Offset  
7        Reserved .....always reads 0  
6-0      Hardware Cursor Position X-Offset

### CR4F-48 – Hardware Cursor Color ..... RW

63-56    Reserved .....always reads 0  
55-32    Hardware Cursor Background Color  
31-24    Reserved .....always reads 0  
23-0     Hardware Cursor Foreground Color

### CR50 – Hardware Cursor Control ..... RW

7        Hardware Cursor Enable  
          0    Disable .....default  
          1    Enable  
6        Hardware Cursor Mode  
          0    MS Windows™ Compatible .....default  
          1    X11 Compatible  
5        Hardware Cursor Color Control 3  
          0    Disable .....default  
          1    Enable  
4        Hardware Cursor Color Control 2  
          0    Disable .....default  
          1    Enable  
3-2     Reserved .....always reads 0  
1-0     Hardware Cursor Size  
          00   128x128 .....default  
          01   64x64  
          10   32x32  
          11   -reserved-

## Additional CRTC Extended Registers

### CR51 – Bus Grant Termination Control ..... RW

7-0 Bus Grant Termination Position

This register is active if CR52[6] = 1

### CR52 – Shared Frame Buffer Control..... RW

7, 5 Shared Frame Buffer (SFB)

00 Disable ..... default

01 Enable SFB slave mode 1 (8ma I/O buffer)

10 Enable SFB master mode

11 Enable SFB slave mode 2 (16ma I/O buffer)

6 Bus Grant Termination Position Control

0 Disable default

1 Enable

4 Reserved .....always reads 0

3-0 Bus Grant Low Pulse (MCLKs) .....def = 0010b

### CR55 – PCI Retry Control..... RW

7 PCI Retry in Memory Write Command

0 Disable default

1 Enable

6 PCI Retry in Memory Read Command

0 Disable default

1 Enable

5-0 Number of PCICLKs \* 2 for STOP# ..... def = 0Fh

Number of PCICLKs, multiplied by 2, for generating STOP# during the first data phase

### CR56 – Display Pre-end Fetch Control ..... RW

7-2 Reserved .....always reads 0

1 Display Queue Pre-end Fetch

0 Disable default

1 Enable

0 Display Queue Pre-end Fetch Parameter Bit-8

Used with CR57 default = 0

### CR57 – Display Pre-end Fetch Parameter ..... RW

7-0 Display Queue Pre-end Fetch Parameter Bit-8

Used with CR56[0] default n/a

### CR5E – Capture / ZV Port Control ..... RW

7 Capture Idle ..... RO

6 Capture Command Port

0 Disable .....default

1 Enable new command port (2203-2200h)

5-3 Reserved ..... always reads 0

2 PCI I/O Write Retry

0 Disable default

1 Enable

1 PCI I/O Read Retry

0 Disable default

1 Enable

0 Capture Interface

0 Disable default

1 Enable

This bit is protected by SRE\_New[7]

### CR5F – Test Control ..... RW

7 Internal Control Test Output

0 Normal.....default

1 Internal control signals are output to P15-0

P15.....GEREQ

P14.....GEBUSY

P13.....CMDIN

P12.....GEWAIT

P11.....CMATCH

P10.....KGECYC

P9.....WBMT

P8.....GERTRY

P7.....BLANKTV

P6.....WRSTY

P5.....WRSTU

P4.....WRSTV

P3.....WRST1

P2.....Y0EN

P1.....Y0EN

P0.....YUVEN

6 Capture Input Interrupt Polarity Select

0 Normal default

1 Test data is output to pixel bus P15-0

5-1 Reserved ..... always reads 0

0 Stop DISPQ REQ Test

0 Normal default

1 Stop DISPQ REQ

# CyberBlade™ i7

## TECHNICAL REFERENCE MANUAL

Rev. 1.0  
8/6/99

### CR62 – Enhancement 0 ..... RW

- 7 **Pause GE Operation (GEPAUSE)**
  - 0 Normal GE Operation ..... default
  - 1 Pause GE Operation
- 6 **PCI Retry for GE (ENGERTRY)**
  - 0 Disable default
  - 1 Enable
- 5 **Short Command (ENSHRT)**
  - 0 Disable default
  - 1 Enable
- 4 **Direct Read Even if GE is Busy (ENDIRRD)**
  - 0 Disable default
  - 1 Enable
- 3 **Reserved** .....always reads 0
- 2 **Low Priority Arbitration Policy**
  - 0 Fixed Priority
  - 1 Round Robin ..... default
- 1 **High Priority Arbitration Policy**
  - 0 Fixed Priority ..... default
  - 1 Round Robin
- 0 **Frame Buffer Memory Size Select**
  - 0 8MB ..... default
  - 1 4MB

### CR63 – Enhancement 1 ..... RW

- 7-6 **Reserved** ..... always reads 0
- 5-4 **Memory Folding Control**
  - 00 Normal default
  - 01 FOLD6
  - 10 FOLD7
  - 11 -reserved-
- 3-2 **Reserved** ..... always reads 0
- 1-0 **Extended FIFO Latency Control (LATV[5-4])**  
Combined with CR30

### CR64 – DPA Extra ..... RW

- 7 **DPA On/Off**
  - 0 On .....default
  - 1 Off
- 6 **DPA Bypass**
  - 0 Normal default
  - 1 Bypass
- 5-3 **Reference Feedback Clock Delay**  
Maximum 2ns default = 0
- 2-0 **Reference Internal Clock Delay**  
Maximum 2ns default = 0

## Video Display and Capture Engine Registers

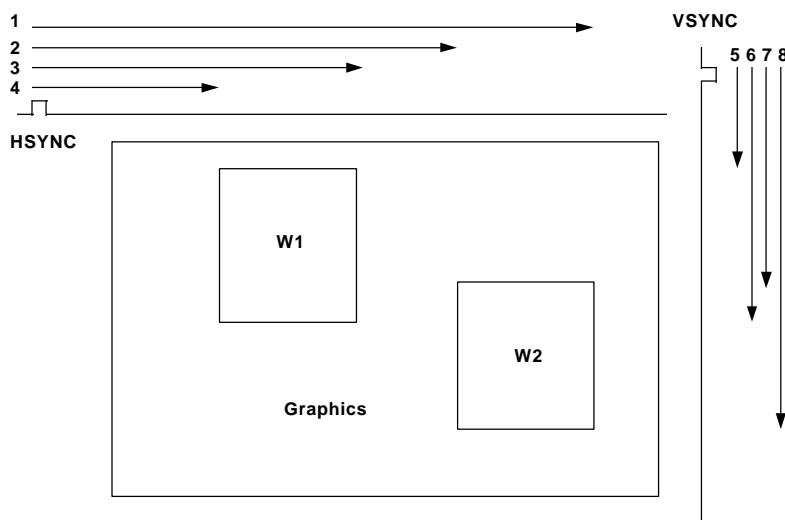

The CyberBlade i7 integrates video display and capture engines, which support YUV 4:2:2, YUV12 (planar) or YUV 4:1:1 data formats to accelerate software playback and video capture functions. Video images can be captured through a special video capture port or the PCI bus. Dual apertures on the PCI bus enable graphics and video data to be transported simultaneously without any software involvement. The video image can be smoothed through a programmable multi-tap filter to reduce the jig-jag effect after minification. The video data can be minified to save bus bandwidth or memory space and written into offscreen memory. The video display engine fetches YUV 4:2:2 or planar video data from offscreen memory and can be scaled up with linear interpolation in both X and Y directions. The video data stream is converted into a True Color RGB24 data stream and multiplexed with the graphics data. Two live video windows can be supported. The graphics data and video data can be handled smoothly in different color depths with color key support. A hardware anti-tear mechanism prevents the tearing effect due to frame buffer update and eases the burden of software to flip the page. Since the hardware synchronizes the capture or PCI video address pointer with the playback VSYNC, the built-in algorithm ensures the playback frame buffer is free from the frame update. For the parameters defined here, refer to the following figures.

Note that W1' is defined for the anti-tearing function. W1 is the first live video storage area and W2 is the second live video storage area. W1 could be in either packed pixel or planar format, while W2 can only be packed pixel mode. If W1 is in packed pixel mode, then W1-U and W1-V are not used. If W1 is in planar mode, then W1-Y is the first live video Y-component storage area, and W1-U (V) is the first live video U (V) -component storage area. In

the following register definitions, a register with W1 (W2) indicates that this parameter is applicable to the first (second) live video window only.

Frame Buffer	Graphics
3D5.94-92	W1 (YUV)
3D5.9A-98	W1-Y
	W1'
3C5.82-80	
	W1-U
3C5.85-83	
	W1-V
3C5.88-86	
	W2

## Digital TV Control Registers

### CRD3-D0 – VGA / Digital TV Sync Control 1 ..... RW

31-27	Reserved .....	always reads 0
26-16	Vertical Data Load	
15	VGA Slave Mode for DTV	
	0 Disable.....	default
	1 Enable	
14	H/V Data Load	
	0 Disable.....	default
	1 Enable	
13	Digital Hsync Direction	
	0 Input.....	default
	1 Output	
12-9	Reserved .....	always reads 0
8-0	Horizontal Data Load	

(see also CRD8, Digital TV Interface Control)

## Extended Registers – CRTIC Shadow

Read/Write of Shadow registers is controlled by extended register GR30[6] (port 3CE/3CF index 30h). If GR30[6]=1, read/write operations to CRTIC indices 0, 3-7, 10-11, and 16 are performed to the shadow registers instead of to the normal registers. Bit definitions for these registers are identical to the standard CRTIC register set.

CR00 – Shadow Horizontal Total..... RW

CR03 – Shadow Horizontal Blank End..... RW

CR04 – Shadow Horizontal Retrace Start..... RW

CR05 – Shadow Horizontal Retrace End..... RW

CR06 – Shadow Vertical Total..... RW

CR07 – Shadow Overflow..... RW

CR10 – Shadow Vertical Retrace Start..... RW

CR11 – Shadow Vertical Retrace End..... RW

CR16 – Shadow Vertical Blanking End..... RW

#### 8.10.4 3D Graphics Engine Registers

This section describes how to program the CyberBlade i7 graphics engine for different operations. When the Setup Engine is to be used, the following steps should be taken to perform the drawing functions:

- Software sets up the drawing environment.
- Software issues a drawing command.
- Software continuously sends triangles to Setup engine.
- Software sends a triangle with last flag set or a null triangle to Setup engine to signal end of operation.

#### Operational Concept

From a programmer's point of view, operations that can be applied to the CyberBlade i7 fall into the following categories:

- Reset: This operation resets the GE to default status.
- Status: This operation returns the GE status.
- Drawing Environment: The operations set environment for drawing.
- Frame Buffer Control: The operations set control for the frame buffer.
- Drawing: Draw an object.
- Geometry Primitives: Describe a geometry primitive.

Drawing Environment defines a set of conditions that decide the operations to be applied to each pixel. Drawing Environment operations are straight-forward. There is a group of registers that defines the drawing environment. By directly setting these registers, a program can control the drawing environment.

Frame Buffer Control decides how to access the frame buffer. Like the Drawing Environment, there is a group of registers that define the frame buffer access. By directly setting these registers, a program can control frame buffer access.

## Drawing

### Bitblt - Frame Buffer to Frame Buffer

Blt operation may involve a pattern. If it does, and the pattern is stored in the frame buffer, the pattern parameters (P1, P2, P3) must also be set. The following registers must be set to provide the source and destination rectangles of blt: Ps1, Pd1, Ps2, and Pd2. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a blt command to Command Register.

### Bitblt - CPU to Frame Buffer

The operation for blting from the CPU is similar to the blting from the frame buffer except that Ps1 and Ps2 are not needed and the data from the CPU must immediately follow the setting of the Command Register.

For all commands that require data from the CPU, the command and data are considered atomic; i.e., the data should follow the command immediately and no other command or parameter can be placed in between. The data can be written to Data Register III and IV. Alternatively, it can be written to a memory-mapped space designated by CyberBlade i7 apertures. The same rule applies to drawing text from the CPU to the frame buffer.

### Text

Text glyph can be from the CPU or the frame buffer. When the glyph is from the CPU, the registers to be set are Pd1 and Pd2 for text location. When the glyph is stored in the frame buffer, the registers to be set are Ps1, Ps2, Pd1, and Pd2 to provide both the glyph and text locations. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a text command to Command Register.

The major difference between text and Blt is that a text source data is 8-bit aligned while the bitblt is 64-bit aligned. That is, for text, each new line starts at the byte boundary, while for a bitblt, at the 64-bit boundary.

### A Note on CPU as the Source of Operation

Any operation that uses the CPU as the source of operation (such as the Blt shown in section x) requires the host CPU to feed data into data registers III and IV (BA+56 and 60). Since the CyberBlade i7 is using the 64-bit internal data path, any data (32-bit) from the CPU will be packed into 64-bit before use. Therefore, there are two registers for the CPU to write. These two registers are arranged as shown in the following diagram.

Writing to Data Register IV triggers data in both registers to be sent to the engine for processing. However, the hardware may expose the two registers as a mapped space to save software from toggling between the two registers.

### Geometry Primitive

To draw a geometry primitive, the host must issue a drawing command by writing to the Command Register first and then set up the geometry as described in later in this document.

## Geometry Primitives

The CyberBlade i7 supports the following geometry primitives: line, and polygon. Each geometry primitive can be further modified for 3D, shading, and texture mapping. A different mechanism, called sequential loading, performs the geometry primitive set up operation.

### Loading Mechanism

There are two ways to set up a geometry primitive, random loading and sequential loading. Like the random access, the order is not important in random loading, but the address is. Writing to a certain address in the register space causes a certain pre-determined action. On the other hand, like sequential access, the order decides the data semantics in sequential loading. The CyberBlade i7 uses sequential loading in the Rasterization Engine and the Setup Engine.

In the CyberBlade i7, parameters don't have to be the fixed addresses. CyberBlade i7 parameters are treated as a data stream and interpreted based on the type of primitive. Parameters must be set in a stream as follows:

Stream Bytes	0	4	4+P1	4+P2	.....	4+Pn
Data	Stream Head	Parameter 1	Parameter 2	Parameter 3	.....	Parameter n+1

P1 is the number of bytes for parameter 1, P2-P1 for parameter 2, etc.

For the Rasterization Engine, there are 9 kinds of parameters: Bresenham Edge, DDA Edge, Z, Texture, Perspective, Color, Specular/fog Start, Specular, and Fog. Parameters must appear in the following order:

Edge(Major), Texture, Perspective, Color, Specular/fog Start, Specular, Fog, Z, Edge(Minor)

There are two kinds of edges and only one kind can appear in a parameter stream. Bresenham Edge can only appear in 2D primitives (without values for iterators).

For the Setup Engine, there is only one kind of parameter: vertex. However, each primitive could have one or three vertices. The size of each vertex is variable depending on triangle attribute.

Only polygon and line primitives can use this sequential loading feature. In the following sections, each primitive is addressed in detail.

### Polygon

General polygons can only be drawn by directly using the Rasterization Engine. In the CyberBlade i7, all polygons must be Y-monolithic, meaning, when walking from the vertex with minimal Y to the vertex with maximum Y, the Y coordinates of the vertices are monolithically increased. A polygon is drawn by drawing a series of segments:

Sequence	Content
0	Drawing Command (Polygon)
1	Full Polygon Segment
2	Polygon Segment (Full or Partial)
3	Polygon Segment (Full or Partial)
....	....
n	Polygon Segment (Full or Partial) or a Null Primitive

A partial segment consists of only one primitive type and one minor edge parameter. A full segment consists of one primitive type, edge parameter(s), and interpolation parameters (Z, color, texture, etc.). The rule is whenever a new major edge is in the segment a full segment must be used, otherwise a partial segment has to be used.

Most bit fields in primitive type define the data to be loaded to Rasterization Engine. If the "Re-load" bit is set, they also define the data set to be passed to Pixel Engine. The primitive type of the first and only the first segment must have the "Re-load" bit set to signal Rasterization Engine the data set to be passed to Pixel Engine. The primitive type of the last and only the last segment must have the "Last" bit set to signal the end of the sequence. The last of the primitive can be a Null primitive (others must be polygon). Null primitive has no parameter.

This mechanism can be used to draw a single polygon, as well as multiple polygons with the same attributes (e.g. 3D texture mapped). All that is required is that somewhere in the sequence we pass a full segment with starting edges of a new polygon.

The following example shows how to draw two shaded polygons.

Sequence	Content
0	Drawing Command
1	Full Segment including Primitive Type: Re-loading, Major & minor edge, color Major edge L1 Color Parameter for L1 Minor edge L2
2	Partial Segment including Primitive Type: minor edge Minor Edge L3
3	Full Segment including Primitive Type: Major edge, color Major Edge L4 Color for L4
4	Partial Segment including Primitive Type: Minor edge Minor Edge L5
5	Full Segment including: Primitive Type: Major & minor edge, color, negative scan direction Major edge L6 Color Parameter for L6 Minor edge L7
6	Partial Segment including: Primitive Type: Minor edge, "Last" Minor Edge L8

The following sections are about complete segments (a full segment with both major and minor edges) with different attributes. A normal full segment may not have the minor edge parameter. A partial segment has no other parameters except the minor edge.

## 2-D

Sequence	Content
0	Primitive Type
1	Major Edge Parameter
2	Minor Edge Parameter

## 3-D

Sequence	Content
0	Primitive Type
1	Major Edge Parameter
2	Minor Edge Parameter

### Texture Mapped

Without perspective correction:

Sequence	Content

Sequence	Content
0	Primitive Type
1	Major Edge Parameter
2	Z Parameter
3	Texture Coordinate Parameter
4	Auxiliary Texture Data Parameter
5	Perspective Factor Parameter
6	Color Parameter
7	Alpha Parameter (optional)

## Triangle

Triangles can be drawn using the Polygon Mechanism described above. Additionally, triangles can also be drawn by using the Setup Engine if they meet certain criteria. Triangles and polygons can also be freely mixed in a drawing sequence. The CyberBlade i7 supports stand-alone triangles as well as a triangle list in a sequence as follows:

Sequence	Content
0	Drawing Command (Polygon)
1	Triangle primitive
2	Triangle primitive
3	Triangle primitive
...	...
1	Triangle primitive

Each primitive consists of a triangle attribute and one or three vertices. The order of the data in each primitive is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertices 1 and 2 are to be loaded depends on the Triangle Attribute. Writing to BA+192 triggers a loading sequence in the Setup Engine. The order of the data in a vertex is: Z, RGBA, UV, W, XY. Not every one has to appear in every vertex. Whether a particular item is present in a vertex is decided by the Triangle Attribute. For example, the Data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, UOV0, XOY0.

Due to the limited precision of the setup engine, only triangles smaller than a certain size will be passed. Software will only pass triangles smaller than 64x128 or 128x64 to the hardware. Also, delta values of RGBAUVZ across a triangle will be less than 128. There is no limitation on the delta of W since it is impossible to exceed 1.

## Line

Parameters for line primitives are very similar to their polygon counter-parts. The differences are as follows:

There are only major edge parameters.

All the dXm values (dRm, dUm, etc.) are ignored.

The following example shows these differences for a texture mapped primitive:

Sequence	Polygon Content	Line Content
0	Drawing Command	Drawing Command
1	Primitive Type	Primitive Type
2	Major Edge	Major Edge
3	Texture Parameter	Texture Parameter
4	Minor Edge	

Using the same mechanism for multiple polygons, multiple lines can also be drawn by issuing one drawing command.

## **Synchronization**

Reset and status operations can be performed in any order and at any time including in the middle of another operation. However, be aware of the consequence (reset) and what to expect (status).

Generally, Drawing Environment and Frame Buffer Control operations should be performed before the drawing operation to take effect.

The primitive operation is considered atomic; i.e., no other operation (except for status and reset) can be performed inside a Geometry Primitive operation.

## **Functional Blocks**

The Cyberblade i7 hardware is divided into 6 major functional blocks. They are:

- Bus Interface (BI)
- VGA core (VGA)
- Setup Engine (SE)
- Rasterization Engine (RE)
- Pixel Engine (PE)
- Memory Interface (MI)

Each functional block conceptually works independently of other blocks. The term "Graphics Engine (GE)" indicates the combination of the Setup Engine, the Rasterization Engine, and the Pixel Engine.

## **Bus Interface**

The bus interface block connects the AGP bus on one side and the GE and VGA on the other side.

## 8.10.5 Span Engine

PS1, PS2, PD1, and PD2 are used in blt and text operations to define source and destination rectangles.

### GEbase + 0 - Parameter Source 1 ..... RW

- 31-28    **Reserved** .....always reads 0
- 27-16    **Y-coordinate Parameter Source 1 Start**  
High 12 bits of parameter source 1 starting address in Y coordinate
- 15-12    **Reserved** .....always reads 0
- 11-0     **X-coordinate Parameter Source 1 Start**  
Low 12 bits of parameter source 1 starting address in X coordinate

### GEbase + 4 - Parameter Source 2 ..... RW

- 31-28    **Reserved** .....always reads 0
- 27-16    **Y-coordinate Parameter Source 2 Start**  
High 12 bits of parameter source 2 starting address in Y coordinate
- 15-12    **Reserved** .....always reads 0
- 11-0     **X-coordinate Parameter Source 2 Start**  
Low 12 bits of parameter source 2 starting address in X coordinate

### GEbase + 8 - Parameter Destination 1 ..... RW

- 31-28    **Reserved** .....always reads 0
- 27-16    **Y-coordinate Parameter Destination 1 Start**  
High 12 bits of parameter destination 1 starting address in Y coordinate
- 15-12    **Reserved** .....always reads 0
- 11-0     **X-coordinate Parameter Destination 1 Start**  
Low 12 bits of parameter destination 1 starting address in X coordinate

### GEbase + C - Parameter Destination 2 ..... RW

- 31-28    **Reserved** .....always reads 0
- 27-16    **Y-coordinate Parameter Destination 2 Start**  
High 12 bits of parameter destination 2 starting address in Y coordinate
- 15-12    **Reserved** .....always reads 0
- 11-0     **X-coordinate Parameter Destination 2 Start**  
Low 12 bits of parameter destination 2 starting address in X coordinate

### 8.10.6 Graphics Engine Core

#### GEbase + 10 - Right View Display Base Address ..... RW

- |       |  |
|-------|--|
| 31    | <b>Right View Active</b>   |
| 0     | Inactive (use VGA style for display start address)..... default                          |
| 1     | Active (use the base register address in this register for the display starting address) |
| 30-24 | <b>Reserved</b> .....always reads 0  |
| 23-0  | <b>Right View Display Starting Address</b>   |

Writing to this register sets Status Register bit-21 to 0. Later when the address is used to display a frame, the status bit is changed to 1.

#### GEbase + 14 - Left View Display Base Address..... RW

- |       |  |
|-------|--|
| 31    | <b>Left View Active</b>  |
| 0     | Disable (only Right View Display Starting Address is used)..... default  |
| 1     | Enable (Right View Display Starting Address is used for the right view and this register for the left view; hardware will use these two addresses alternately) |
| 30-24 | <b>Reserved</b> .....always reads 0  |
| 23-0  | <b>Left View Display Starting Address</b>  |

Writing to this register sets Status Register bit-20 to 0. Later when the address is used to display a frame, the status bit is changed to 1.

#### GEbase + 18 - Block Write Start Address..... RW

- |       |  |
|-------|--|
| 31    | <b>Linear Mode</b>                                 |

    - 0   Idle
    - 1   Busy
  - 28     Memory Interface Status**
    - 0   Idle
    - 1   Busy (access for screen refresh doesn't count)
  - 27     Command List Processing Status**
    - 0   Idle
    - 1   Busy
  - 26     Block Write Status**
    - 0   Idle
    - 1   Busy
  - 25     Command Buffer Status**
    - 0   Not full
    - 1   Full
  - 24     Reserved** .....always reads 0
  - 23     PCI Write Buffer Status**
    - 0   Empty
    - 1   Not empty
  - 22     Z Check Status**
    - 0   Engine busy: All Z tests performed so far have failed in the command being executed.  
Engine idle: All Z tests performed in the last command have failed.
    - 1   Otherwise
- Logically, this bit is the OR of all Z test results performed in the latest command
- 21     Effective Status**
    - 0   Current display base register is not yet effective (the frame is not displayed)
    - 1   It is effective
  - 20     Left View Status**
    - 0   Current display base register is not yet effective (the frame is not displayed)
    - 1   It is effective
  - 19     Last View Displayed / Being Displayed**
    - 0   Right View
    - 1   Left View
  - 18-11   Reserved** .....always reads 0
  - 10-0     Scan Line Currently Being Displayed**

There are two input FIFOs to buffer data and commands from the host, the Command FIFO (8 levels deep) and the Bresenham FIFO (2 levels deep). Drawing commands, Drawing Environment, and Frame Buffer Control are routed through the Command FIFO. Primitive Type and Geometry Primitives are routed through the Bresenham FIFO. Commands in the Command FIFO don't take effect until a prior command is executed or the task in progress is finished. Parameters in the Bresenham FIFO don't take effect until a prior parameter is phased out (reaches the end of an edge).

**GEbase + 24 – Graphics Engine Control ..... WO**

7	Reset	
0	Normal operation .....	default
1	Reset all internal registers and pointers. Reset is performed by setting this bit to 1 and then back to 0.	
6-4	Reserved .....	always reads 0
3-0	Debug Module Select .....	default = 0

**GEbase + 28 – Graphics Engine Debug ..... RO**

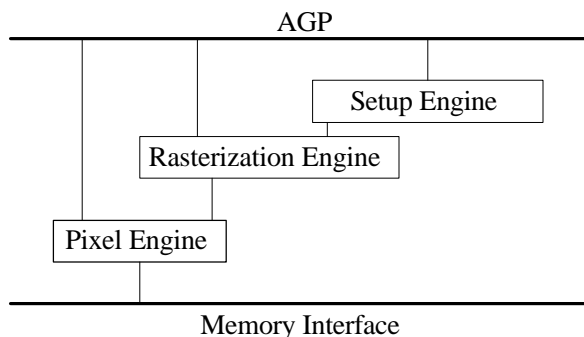

31-0	Engine Module Status
	(See register 24 bits 3-0 above)

**GEbase + 2C – Graphics Engine Wait Mask ..... RW**

31-0	Wait Mask
	When writing to this register, hardware will monitor the value of M (Wait Mask & Status). If M is not 0, the Graphics Engine (including the RE, SE, PE, and MI) will not accept new registers from the host CPU or AGP bus. This register is cleared by the hardware when M = 0. Only bits 31-28, 26, 23, and 21-20 are effective (all other bits are ignored).

## Graphics Engine Organization

The CyberBlade i7 Graphics Engine consists of the following units: Setup Engine, Rasterization Engine, and Pixel Engine. These units are organized as follows:

The interfaces among the components are:

- AGP to Pixel Engine: Set drawing environment registers.
- AGP to Rasterization Engine: Set primitives: edge walking, slopes.
- AGP or Setup Engine: Set vertices, culling info.
- Setup Engine to Rasterization Engine: Set primitives: edge walking, slopes.
- Rasterization Engine to Pixel Engine: Pixel Data, addresses and coordinates.
- Pixel Engine to Memory Interface: Addresses and coordinates, pixel data.

Each unit performs the following functions:

- Setup Engine: Back face culling, slope calculation.
- Rasterization Engine: Edge walking, color interpolation, Z, texture coordinates, perform perspective correction.
- Pixel Engine: Generate addresses and coordinate for all memory accesses: read/write Z, read texture, read source/destination, write destination (draw buffer), 2-D functions, bi/tri-linear interpolation, blending and modulation, ROP, Z test, alpha test, transparency, etc.

When the Setup Engine is to be used, the following steps should be taken to perform drawing functions:

- S/W sets up the drawing environment.
- S/W issues a drawing command.
- S/W continuously sends triangles to the Setup Engine (or primitives to the Rasterization Engine).
- S/W sends a triangle with last flag set or a null triangle to the Setup Engine to signal the end of the operation (or its equivalent to the Rasterization Engine).

Triangles sent to the Setup Engine can be interleaved with primitives sent to the Rasterization Engine in step 3 above.

The Setup Engine uses the same sequential loading mechanism as in the Rasterization Engine. The order of loading is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertex 1 and 2 are to be loaded depends on the Primitive Type. Writing to BA+4Ch triggers a loading sequence to the Setup Engine. The order of data in a vertex is: RGBA, SrgbF, W, UV, Z, XY. Not every one will appear in every vertex. Whether a particular item will be present in a vertex is decided by the Triangle Attribute. For example, the data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, U0V0, X0Y0.

### GEbase + 2C – Setup Engine Status.....RO

#### **31-0 Overflow Status**

This register records setup engine overflow status. For every triangle, the entire register is shifted left one bit with bit-0 then set to reflect whether the triangle has slope overflow. This register is useful for debugging purposes. This register resides in the VGA address space and is not decoded by the setup engine.

### Setup Engine Registers

#### GEbase + 30 – Setup Engine Primitive Attribute ..... RW

31	<b>Z Parameter</b>	
	0 Absent..... default	
	1 Present (Setup Engine calculates Z slope)	
30	<b>Texture Parameter</b>	
	0 Absent..... default	
	1 Present (SE calculates Z slope)	
29	<b>Perspective Factor Parameter</b>	
	0 Absent..... default	
	1 Present (SE calculates W slope)	
28	<b>Color Parameter</b>	
	0 Absent..... default	
	1 Present (SE calculates color slope)	
27	<b>Specular Color Parameter</b>	
	0 Absent..... default	
	1 Present (SE calculates specular slope)	
26	<b>Fog Parameter</b>	
	0 Absent..... default	
	1 Present (SE calculates fog slope)	
25	<b>Step Mode</b>	
	0 Disable..... default	
	1 Enable (SE will process the next primitive only when it finishes the current primitive. There is no parallelism between primitives)	
24-20	<b>Reserved</b>	.....always reads 0
19-15	<b>LOD Adjust</b>	..... default = 0
	3.2 signed # to be added to calculate the LOD value	
14-7	<b>Reserved</b>	.....always reads 0

6	<b>Z Normalization (Setup Engine Only)</b>	
	0 Disable ..... default	
	1 Enable	
5	<b>Flat Mode</b> (applies to diffuse color, alpha, specular color, and fog)	
	0 Smooth color or no color ..... default	
	1 Flat color. SE sends only starting values to RE	
4	<b>Full Vertex Info</b>	
	0 Disable ..... default	
	1 Enable. Indicates that all vertex data are needed for the triangle. Software still needs to set bits 31-25. However in this case, the data order in a vertex is: X, Y, Z, W, RGBA, SrgbF, U, V. Even though the vertex actually contains all the data, software doesn't necessarily set this bit. When this bit is not set, hardware decodes vertex data as described in the Vertex Register descriptions.	
3 Only)	<b>Sub-Pixel Precision (Rasterization Engine Only)</b>	
	0 Disable ..... default	
	1 Enable	
2	<b>Anti-Aliasing (RE Only)</b>	
	0 Disable (walk at pixel precision) ..... default	
	1 Enable (walk at sub-pixel precision)	
1	<b>Auto Direction for Scan Line Ends (RE Only)</b>	
	0 Disable ..... default	
	1 Enable. Bits 31-2 must be 0. Scan order is passed to the Pixel Engine based on the comparison result of two end points instead of the bit in the Primitive Type register. Software should only use this bit for 2D polygons with Bresenham edge walking.	
0	<b>Bresenham Edge Walking (RE Only)</b>	
	0 Use DDA to walk through edges ..... default	
	1 Use Bresenham algorithm to walk through edges	

This register is decoded by the Setup Engine and passed to the Rasterization Engine by the Setup Engine. This register and its equivalent part in the Rasterization Engine are "partially" pipelined in the sense that there are only two levels of pipe for this register in both engines while there are many levels for other data. The two levels are the decoding level and the execution level. Both the Rasterization Engine and the Setup Engine use this register to decide what kind of operation to perform and what kind of data stream to expect. It must be set before any parameter can be loaded.

### GEbase + 3C –Setup Engine Primitive Type.....WO

Writing to this register signals the Graphics Engine to begin sequential loading. The engine will interpret the contents of this register and the Primitive Attribute register to decide the amount and types of parameters to expect. Like vertices, there is a FIFO for Triangle Attributes. The queue has three entries. Writing to this register adds it to the queue. The Setup Engine starts working whenever a triangle attribute is received and stops after it is finished processing a triangle with L = 1.

#### **31-30 Loading Target**

- 00 Rasterization Engine. Send bits 19-0 to the RE. Sequential loading data will also be sent to the RE ..... default
- 01 Setup Engine. Send bits 29-0 to the SE. Sequential loading data will also be sent to the SE. Internally, a flag is set to prevent the SE from decoding the data and sending it to the RE. The SE will clear this flag when it is idle.

1x -reserved-

#### **29 Null Primitive**

- 0 Regular Primitive ..... default
- 1 Null Primitive

#### **28 Last Primitive**

- 0 Regular Primitive ..... default
- 1 Last Primitive

#### **27-26 Culling Attribute (Setup Engine Target Only)**

- 00 No culling ..... default
- 01 Clockwise culling
- 10 Counter-clockwise culling
- 11 No culling

#### **25 Reserved .....always reads 0**

#### **24 (V2, V0) Edge Anti-Aliasing Flag..... default = 0**

#### **23 (V1, V2) Edge Anti-Aliasing Flag ..... default = 0**

#### **22 (V1, V1) Edge Anti-Aliasing Flag ..... default = 0**

#### **21 Full Vertices Information**

- 0 Partial Vertices Information. Two of the vertices are from the previous triangle. Only one vertex is to be loaded from the vertex queue to the working registers..... default
- 1 All vertices are new. All three working registers are to be loaded from the vertex queue.

#### **20-19 Working Vertex Index**

Index of the working vertex that is to be replaced. This field is always 0 if F = 1.

#### **18-3 Reserved .....always reads 0**

#### **2 Debug Control**

- 0 Discard triangle on overflow ..... default
- 1 Draw triangle on overflow

#### **1-0 Flat Color Vertex Index**

Vertex index for flat color (Index of vertex whose color is passed to the RE as the starting color)

## **Vertex Registers**

Inside the setup engine, one set of registers is provided to store the three vertices it is currently working on and an additional set is provided to store three pending vertices. Note that it doesn't always require 3 vertices to define a triangle (depending on the Triangle Attribute Register, it may be either 1 or 3 vertices).

Vertex information includes coordinate, texture, color, and depth. Some may be absent in a data stream. If any appear in a vertex, they must be present in the following order: Color, Specular Color, W, U, V, Z, X, Y. The formats are shown below:

### Vertex Register 1 - Color Value

- 31-24 Alpha Value
- 23-16 Red Value
- 15-8 Green Value
- 7-0 Blue Value

### Vertex Register 2 - Specular Color Value

- 31-24 Fog Value
- 23-16 Specular Red Value
- 15-8 Specular Green Value
- 7-0 Specular Blue Value

### Vertex Register 3 - W Value

- 31-0 Texture W Coordinate. 32-bit floating # in (0, 1.0)

### Vertex Register 4 - U Value

- 31-0 Texture U Coordinate. 32-bit floating number

### Vertex Register 5 - V Value

- 31-0 Texture V Coordinate. 32-bit floating number

### Vertex Register 6 - Z Value

- 31-0 Z Coordinate. 32-bit floating number

### Vertex Register 7 - X Value

- 31-0 X Coordinate. 32-bit floating number

### Vertex Register 8 - Y Value

- 31-0 Y Coordinate. 32-bit floating number

## **Floating Point Number Format**

All floating point numbers are converted by on-chip hardware into internal fixed point integer format. All floating point numbers are specified in IEEE 32-bit floating point number format (shown below):

- 31 Sign
- 30-23 Exponent (excess-127 format)
- 22-0 Mantissa (fractional part of a number in "1.nn" format where the integer part is always 1)

## Rasterization Engine Registers

The major responsibilities of the Rasterization Engine are:

- Receive data from host: Set registers, sequential loading of parameters.
- Edge walking: Generate end points of polygon edges or pixels on a line.
- Interpolation: Calculate values such as texture coordinates on a polygon / line.
- Perspective correction: Perform perspective correction.

In the CyberBlade i7, the Rasterization Engine performs color (including alpha) interpolation, texture coordinate (perspective corrected) generation, Z coordinate interpolation, and texture gradient (perspective corrected) calculations.

Host access to the Rasterization Engine is by sequential writes to minimize AGP bandwidth requirements. This is not needed for the Setup Engine to access the Rasterization Engine. In addition, if sequential parameters were used to interface between the Setup Engine and the Rasterization Engine, it would incur extra cost for the Setup Engine to pack data and would also reduce performance. Therefore, the Setup Engine accesses working registers in the Rasterization Engine directly. To synchronize operation, hardware must wait until the Setup Engine becomes idle to accept data from the host to the Rasterization Engine.

Both Rasterization and Setup Engines share one interface to the AGP Write Buffer. The first reason is that both Rasterization Engine and Setup Engine use stream decoding to receive data from the host. Once they are inside a stream, they must act quickly to grab data to prevent other components from taking the data. Having two stream decoders in the graphics engine is a potential source for problems. The second reason is that both the Rasterization Engine and Setup Engine handle the same types of data. Coupling them tightly makes the design easier and reduces problems that arise from synchronization. The third reason is for better synchronization between the two engines.

The engine interfaces to the host through both random access registers and sequential loading. There are two random access registers: Primitive Attribute and Primitive Type. The Primitive Attribute register consists of most parameter information from the Rasterization Engine's Primitive Type and the Setup Engine's Triangle Attribute register.

The address space that can be used by sequential loading parameters is from Base Address + 40h to Base Address + FFh. Software should not use addresses outside this space for parameters. **Sequential loading must use the address in this space starting at 0x40H in ascending order.** For example, the first address must be 40h, the next must be 44h, etc. In order to give time to notify the other component to stop decoding, **address 40h is exclusively reserved for sequential loading.**

**GEbase + 30 – RE Primitive Attribute ..... RW**

31	<b>Z Parameter</b>
0	Absent..... default
1	Present (Rasterization Engine calculates Z slope)
30	<b>Texture Parameter</b>
0	Absent..... default
1	Present (RE calculates texture info)
29	<b>Perspective Factor Parameter</b>
0	Absent..... default
1	Present (RE performs perspective correction)
28	<b>Color Parameter</b>
0	Absent..... default
1	Present (RE calculates Gouraud color (RGBA))
27	<b>Specular Color Parameter</b>
0	Absent..... default
1	Present (RE calculates specular color)
26	<b>Fog Parameter</b>
0	Absent..... default
1	Present (RE calculates fog)
25	<b>Step Mode</b>
0	Disable..... default
1	Enable (RE will process the next primitive only when it finishes the current primitive. No parallelism exists between primitives)
24-20	<b>Reserved</b> .....always reads 0
19-15	<b>LOD Adjust</b> ..... default = 0
	3.2 signed # to be added to calculate the LOD value
14-7	<b>Reserved</b> .....always reads 0

6	<b>Z Normalization (Setup Engine Only)</b>
0	Disable ..... default
1	Enable
5	<b>Flat Mode</b> (applies to diffuse color, alpha, specular color, and fog)
0	Smooth color or no color ..... default
1	Flat color. RE forces deltas to 0.
4	<b>Full Vertex Info</b>
0	Disable ..... default
1	Enable. Indicates that all vertex data are needed for the triangle. Software still needs to set bits 31-25. However in this case, the data order in a vertex is: X, Y, Z, W, RGBA, SrgbF, U, V. Even though the vertex actually contains all the data, software doesn't necessarily set this bit. When this bit is not set, hardware decodes vertex data as described in the Vertex Register descriptions.
3	<b>Sub-Pixel Precision (Rasterization Engine Only)</b>
0	Disable ..... default
1	Enable

## Bresenham Edge Parameters

Bresenham Edge parameters describe an edge of a primitive or a line.

### DoubleWord 0 – Start Coordinates

#### **31-16 Start YS1**

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

#### **15-0 Start XS1**

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

### DoubleWord 1 – Drawing Direction / Bresenham

#### **Constant**

#### **31 YS Drawing Direction**

- 0 Positive
- 1 Negative

#### **30 XS Drawing Direction**

- 0 Positive
- 1 Negative

#### **29 Swap**

- 0 Normal (X / Y not swapped)
- 1 X / Y swapped

#### **28-16 Bresenham (or Modified) Constant**

#### **15-13 Reserved ..... ignored**

#### **12-0 Bresenham (or Modified) Constant**

### DoubleWord 2 – Error Term / Strip Length

#### **31-29 Reserved ..... must be written as zero**

#### **28-16 Initial Error Term**

#### **15-12 Reserved ..... must be written as zero**

#### **11-0 Strip Length**

Strip length of modified Bresenham line.

## DDA Edge Parameters

DDA Edge parameters describe an edge of a primitive or a line.

### DoubleWord 0 – Start Coordinates

#### **31-16 Start YS1**

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

#### **15-0 Start XS1**

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

### DoubleWord 1 – Drawing Direction / Edge Slope

#### **31 YS Drawing Direction**

- 0 Positive
- 1 Negative

#### **30 XS Drawing Direction**

- 0 Positive
- 1 Negative

#### **29 Swap**

- 0 Normal (X / Y not swapped)
- 1 X / Y swapped

#### **28-26 Reserved ..... ignored**

#### **25-0 Edge Slope**

12.14 signed number

When a DDA edge is used as a polygon boundary, the fractional bits should round up to the next integer. Interpolation values should be adjusted accordingly. DDA edge walking shares the same logic as Bresenham edge walking by using an error advance method. In DDA walking, fractional bits should be rounded up to the next integer. Rounding up is performed by changing drawing convention according to whether the fractional parts are 0 as follows:

- Left fractional is 0: Left inclusive.
- Left fractional is not 0: Left exclusive.
- Right fractional is 0: Right exclusive.
- Right fractional is not 0: Right inclusive.

Because the error advance method is used for DDA walking, the fractional part is always one step ahead of the coordinate. For the starting point of a line, the fractional part is assumed to be 0.

### Color Parameters

Color parameters are used for Gouraud shading. They consist of starting values, incremental along the X and Y axis. **In flat color mode, this parameter only has the starting value.**

#### DoubleWord 0 – Initial Values

##### **31-24 Initial Alpha Value**

Initial Alpha value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **23-16 Initial Red Value**

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **15-8 Initial Green Value**

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **7-0 Initial Blue Value**

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

#### DoubleWord 1 – X-Axis Blue Gradient

##### **31-0 X-Axis Blue Gradient**

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 2 – Y-Axis Blue Gradient

##### **31-0 Y-Axis Blue Gradient**

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 3 – X-Axis Green Gradient

##### **31-0 X-Axis Green Gradient**

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 4 – Y-Axis Green Gradient

##### **31-0 Y-Axis Green Gradient**

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 5 – X-Axis Red Gradient

##### **31-0 X-Axis Red Gradient**

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 6 – Y-Axis Red Gradient

##### **31-0 Y-Axis Red Gradient**

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 7 – X-Axis Alpha Gradient

##### **31-0 X-Axis Alpha Gradient**

Gradient of Alpha along the X axis over the primitive surface. Signed 20.12 number.

#### DoubleWord 8 – Y-Axis Alpha Gradient

##### **31-0 Y-Axis Alpha Gradient**

Gradient of Alpha along the Y axis over the primitive surface. Signed 20.12 number.

### Z Value Parameters

To the Rasterization Engine, the Z value is always a 25.8 signed integer internally regardless of Z buffer depth. It always passes a 24-bit unsigned integer to the Pixel Engine. It is the Pixel Engine's responsibility to scale Z to the depth of the Z buffer. Z parameters are used to calculate depth information. Z values consist of starting values, incremental along the X and Y axis.

#### DoubleWord 0 – Initial Z Value

##### **31-0 Initial Z Value**

Initial Z value on main edge (left edge of trapezoid or long edge of triangle). Signed 25.7 integer.

#### DoubleWord 1 – X-Axis Z Gradient

##### **31-0 X-Axis Z Gradient**

Gradient of Z along the X axis over the primitive surface. Signed 25.7 number.

#### DoubleWord 2 – Y-Axis Z Gradient

##### **31-0 Y-Axis Z Gradient**

Gradient of Z along the Y axis over the primitive surface. Signed 25.7 number.

#### DoubleWord 3 – Minimum Z Threshold

**31-24 Reserved** ..... Ignored

##### **23-0 Minimum Z Threshold**

Minimum of Z threshold. Unsigned 24-bit integer.

#### DoubleWord 4 – Maximum Z Threshold

**31-24 Reserved** ..... Ignored

##### **23-0 Maximum Z Threshold**

Maximum of Z threshold. Unsigned 24-bit integer.

### Texture Coordinate Parameters

Texture parameters are used for texture mapping. They consist of starting values, incremental along the X and Y axis.

#### DoubleWord 0 – Initial U Value

##### **31-0 Initial U Value**

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

#### DoubleWord 1 – Initial U Value

##### **31-0 Initial U Value**

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

#### DoubleWord 2 – X-Axis U Gradient

##### **31-0 X-Axis U Gradient**

Gradient of U along the X axis over the primitive surface. Signed 16.16 number.

#### DoubleWord 3 – Y-Axis U Gradient

##### **31-0 Y-Axis U Gradient**

Gradient of U along the Y axis over the primitive surface. Signed 16.16 number.

#### DoubleWord 4 – X-Axis V Gradient

##### **31-0 X-Axis V Gradient**

Gradient of V along the X axis over the primitive surface. Signed 16.16 number.

#### DoubleWord 5 – Y-Axis V Gradient

##### **31-0 Y-Axis V Gradient**

Gradient of V along the Y axis over the primitive surface. Signed 16.16 number.

### Perspective Factor Parameters

Perspective factor parameters are used for perspective corrected texture mapping. They consist of W starting values incremental along the X and Y axis.

#### DoubleWord 0 – Initial W Value

##### **31-0 Initial W Value**

Initial W value on main edge (left edge of trapezoid or long edge of triangle). Signed 4.28 integer.

#### DoubleWord 1 – X-Axis W Gradient

##### **31-0 X-Axis W Gradient**

Gradient of W along the X axis over the primitive surface. Signed 4.28 number.

#### DoubleWord 2 – Y-Axis W Gradient

##### **31-0 Y-Axis W Gradient**

Gradient of W along the Y axis over the primitive surface. Signed 4.28 number.

### **Specular / Fog Start Value**

The specular / fog start value is used for specular shading or fogging.

#### **DoubleWord 0 – Start Value**

##### **31-24 Initial Fog Value**

Initial Fog value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **23-16 Initial Red Value**

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **15-8 Initial Green Value**

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

##### **7-0 Initial Blue Value**

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

### **Specular Parameters**

Specular parameters are used for specular shading. These parameters are not present in flat color mode and consist of starting values incremental along the main direction ((dx, dy) = (M1, 1)), and incremental along the X axis.

#### **DoubleWord 0 – X-Axis Blue Gradient**

##### **31-0 X-Axis Blue Gradient**

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 1 – Y-Axis Blue Gradient**

##### **31-0 Y-Axis Blue Gradient**

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 2 – X-Axis Green Gradient**

##### **31-0 X-Axis Green Gradient**

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 3 – Y-Axis Green Gradient**

##### **31-0 Y-Axis Green Gradient**

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 4 – X-Axis Red Gradient**

##### **31-0 X-Axis Red Gradient**

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 5 – Y-Axis Red Gradient**

##### **31-0 Y-Axis Red Gradient**

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

### **Fog Parameters**

Fog parameters are used for fogging. These parameters are not present in flat color mode and consist of starting values incremental along the X and Y axis.

#### **DoubleWord 0 – X-Axis Fog Gradient**

##### **31-0 X-Axis Fog Gradient**

Gradient of Fog along the X axis over the primitive surface. Signed 20.12 number.

#### **DoubleWord 1 – Y-Axis Fog Gradient**

##### **31-0 Y-Axis Fog Gradient**

Gradient of Fog along the Y axis over the primitive surface. Signed 20.12 number.

## Pixel Engine Registers

The major responsibilities of the Pixel Engine are to perform per-pixel operations and to control data flow and its sequence.

The Pixel engine interfaces to the Rasterization Engine and the host to accept data. It also interfaces to the Memory Interface to access video memory. Inside the Pixel Engine, there are several blocks: the Span Engine, the Data Path, and the Texture Engine. Operation of the Data Path and the Texture Engine are under control of the Span Engine. The Memory Interface accepts memory access requests from the Pixel Engine, translates the address into a linear address, and executes the requests.

The 0 - FFh "Engine" register address space is partitioned into six sections:

0 - 0Fh	Span Engine
10 - 2Fh	VGA core
30 - 3Fh	Unified Rasterization and Setup Engines
44 - 9Fh	Pixel Engine
A0 - AFh	Texture Engine
B0 - BFh	Command List Control Unit
C0 - FFh	Memory Interface

Addresses 40h - FFh are also used for sequential loading overlapping with other registers in this space. Addresses 10000 - 1FFFFh are used as a data port area.

## Data from the Host

The Pixel Engine can accept data from the host through either the 32-bit data port register at 9Ch or data in the 1xxxh address space. **Software passes only enough DWORDs to hardware. Software doesn't pack data to 64-bit boundaries. It only packs to 32-bit boundaries.** For bitblts, packing is done per-scanline. I.e., for every scanline, the host will send just enough DWORDs to the engine. For text, packing is done per-command. I.e., the scanline may be broken inside a DWORD. For a string of texts, the number of DWORDs of data passed to the Graphic Engine can be odd numbers except for the last character. For the last character, software should pass either an even number of DWORDs (by padding a garbage DWORD as necessary) or by setting a drawing environment register after all data is sent.

### GEbase + 44 – Drawing Command.....RW

Writing to the Drawing Command register starts a drawing operation. When this register is set, the drawing environment registers and memory interface registers are locked in. Any change to these registers will not affect this drawing operation. Furthermore, the Pixel Engine will not accept any data from the host or from the Rasterization Engine without a drawing command. After a drawing command is issued, the Pixel Engine will selectively accept data from the host or Rasterization Engine depending on the command. Specifically, the Pixel Engine only accepts data from the host if the command is text or blt and the BS field indicates the source is from the host. The Pixel Engine only accepts data (scanlines, Z, color, etc.) from the Rasterization Engine if the command is line or polygon.

<b>31-28</b>	<b>Operation Code</b>
0000	Null Command ..... default
0001	-reserved-
0010	Line
0011	-reserved-
01xx	-reserved-
1000	Bit-Blt (see note below)
1001	Text (see note below)

## GEbase + 50 – Texture Function ..... RW

31-22	Maximum U
21-12	Minimum U
11-5	Reserved .....always reads 0
4	Mask
	0 Disable
	1 Enable
3-2	Texture Alpha
	00 Texel alpha
	01 Source alpha
	10 Modulated alpha: texel alpha x source alpha
	11 -reserved-
1-0	Texture Color
	00 Texel color
	01 Source color
	10 Modulated color: texel color x source color
	11 -reserved-

## GEbase + 54 – Clipping Window 0 ..... RW

31-28	Reserved .....always reads 0
27-16	Clipping Window Top ..... default = 0
15-12	Reserved .....always reads 0
11-0	Clipping Window Left ..... default = 0

## GEbase + 58 – Clipping Window 1 ..... RW

31-28	Reserved .....always reads 0
27-16	Clipping Window Bottom ..... default = 0
15-12	Reserved .....always reads 0
11-0	Clipping Window Right ..... default = 0

## GEbase + 60 – Color 0 (Foreground)..... RW

31-0 Foreground Color Value

## GEbase + 64 – Color 1 (Background)..... RW

31-0 Background Color Value

Note: In 16- and 8- bit modes, the color must be duplicated to fill an entire 32-bit word. 32-bit color is in ARGB format (i.e., Alpha, Red, Green, and Blue in bytes 3-0 respectively) and 16-bit color is in RGB 565 format (5 bits of Red, 6 bits of Green, and 5 bits of Blue).

## GEbase + 68 – Color Key..... RW

31-26 Reserved ..... always reads 0

25 Destination Polarity

0 Draw on Equal

1

24 Source Polarity

0 Draw on Equal

1

23-0 Destination Color Key Color

Unlike foreground and background, the color is not replicated in 16-bit or 8-bit modes.

**GEbase + 6C – Pattern and Style ..... RW**

- 31 Pattern Color Expansion**  
0 Disable ..... default  
1 Enable
- 30 Pattern Transparency**  
0 Opaque ..... default  
1 Transparent
- 29 Pattern Size**  
0 8 x 8 pixels ..... default  
1 32 x 32 pixels (mono only)
- 28 Pattern Register Segment**  
0 Low Segment ..... default  
1 High Segment

Note: The pattern cache is divided into two segments for double pattern purposes. This bit serves two purposes: First as the starting segment for loading a pattern into the pattern cache, the corresponding address is latched into an internal register which will automatically increase by one when data is loaded. Second as the segment base of the current pattern when applying a pattern.

**27-24 Reserved** .....always reads 0

**23-16 Pattern Style Step**

The # of pixels each mask bit should be mapped to:

- 00 1 Pixel per mask bit ..... default  
01 2 pixels per mask bit  
02 3 pixels per mask bit  
... ..  
FF 256 pixels per mask bit

**15-0 Pattern Style Mask**

Determines the line drawing style (e.g., dotted line). Bit-0 maps to the first pixel. Writing to the low byte of this register (GEbase + 6C) causes the internal style count to be reset to 0. When 3D operations are enabled (smooth shading, texture, Z), style line must be transparent and style applies to color as well as Z.

**GEbase + 74 – Pattern Foreground Color ..... RW**

- 31-0 Foreground Color Value** ..... default = 0

**GEbase + 78 – Pattern Background Color ..... RW**

- 31-0 Background Color Value** ..... default = 0

Note: In 16- and 8- bit modes, the color must be duplicated to fill an entire 32-bit word. 32-bit color is in ARGB format (i.e., Alpha, Red, Green, and Blue in bytes 3-0 respectively) and 16-bit color is in RGB 565 format (5 bits of Red, 6 bits of Green, and 5 bits of Blue).

**GEbase + 70 – Pattern Color ..... RW**

**31-0 Pattern Color Value**

Must follow the command. The pattern data could be repeated up to 64 times to fill out the pattern register file.

**GEbase + 7C – Alpha    RW**

31-16	Reserved .....	always reads 0
15-8	Source Constant Alpha	
7-0	Destination Constant Alpha	

**GEbase + 84 – Bit Mask..... RW**

31-0	Bit Mask
One bits indicate that the corresponding color bit will not be written to the frame buffer.	

**GEbase + 80 – Alpha Function..... RW**

31-24	Reserved .....	always reads 0
23	Alpha Write	
	0    Disable .....	default
	1    Enable. Draw each pixel with a blended alpha value if alpha blending is enabled. Otherwise draw with source alpha (the upper byte of the Foreground Color register if not available).	
This bit should be set in 8-bit and 16-bit color modes.		
22	Constant Source Alpha	
	0    Disable .....	default
	1    Enable	
21	Constant Destination Alpha	
	0    Disable .....	default
	1    Enable

	1011    -reserved-	
	11xx    -reserved-	

## Texture Engine Registers

The texture Engine handles texture access and filtering. It is controlled by the Span Engine. It accepts texture coordinates from the Rasterization Engine, generates and passes addresses to the Memory Interface, accepts raw texel data from the Memory Interface, does filtering, and passes the results to the Data Path.

### **GEbase + A0 – Texture Control..... RW**

Textures are aligned to 64-bit boundaries on a scanline basis.

- 31 Texture Access Control**
  - 0 Disable (use cache)
  - 1 Enable (bypass cache)
- 30 Filtering Control**
  - 0 Filter with color key. Treat alpha value for keyed texels as 0
  - 1 Downgrade filtering function based on fractional bits of UV and key test result. Set alpha to 0 for keyed texels.
- 29-28 Texture U Boundary Checking Function**
  - 00 Texture U wraparound
  - 01 Texture U mirroring
  - 10 Texture U clamping
  - 11 -reserved-
- 27-26 Texture V Boundary**
  - 00 Texture V wraparound
  - 01 Texture V mirroring
  - 10 Texture V clamping
  - 11 -reserved-
- 25 Texture in System Memory**
  - 0 Texture is stored in graphics memory
  - 1 Texture is stored in system memory
- 24 Reserved (must be 0)**
- 23 MipMap**
  - 0 Disable
  - 1 Enable
- 22 Intra-map Filter**
  - 0 Disable
  - 1 Enable (do filtering inside a LOD level)
- 21 Inter-map Filter**
  - 0 Disable
  - 1 Enable (do filtering inside a LOD level)  
M must be 1.
- 20 Magnify Filter (when LOD < 0)**
  - 0 Point Sample
  - 1 Bi-linear

## **19 Tiling**

- 0 Texture is not tiled
- 1 Texture is tiled.

Tile size is determined by texel depth:

<u>Texel Depth (bpp)</u>	<u>Tile Size</u>
1	16 x 16
2	8 x 16
4	8 x 8
8	4 x 8
16	4 x 4
32	2 x 4

Inside each tile, texels are organized into 2x2 subtiles in row major

## **18 Texture Color Key**

- 0 Disable
- 1 Enable

## **17 Texture Anisotropy**

- 0 Disable
- 1 Enable

## **16-15 Palette Data Format**

- 00 565 RGB
- 01 1555 ARGB
- 10 4444 ARGB
- 11 -reserved-

## **14-12 Texel Depth**

- 000 1-bpp palettized
- 001 2-bpp palettized
- 010 4-bpp palettized
- 011 8-bpp palettized
- 100 16-bpp 565 RGB
- 101 16-bpp 1555 ARGB
- 110 16-bpp 4444 ARGB
- 111 32-bpp ARGB

## **11-8 Texture Map Levels (TML) (Range 0-8)**

The number of maps in the MipMap (0 = 1 map)

## **7-4 Y-Axis Texture Memory Size (TRY) (Range 0-8)**

This field determines the number of lsb's (2\*\*TRY) of parameter V to be used in the Y axis. Any bit higher than this will be ignored (wraparound).

## **3-0 X-Axis Texture Memory Size (TRX) (Range 0-8)**

This field determines the number of lsb's (2\*\*TRX) of parameter U to be used in the X axis. Any bit higher than this will be ignored (wraparound).

Note: For MipMap textures, TRX/TRY is the size of the original texture (1:1 map)

**GEbase + A4 – Texture Color ..... RW**

- 31-24 Alpha**  
Constant alpha value when there is no alpha in the texture format
- 23-0 Texture Color Key**  
Texture transparency color (888 RGB)

**GEbase + A8 – Texture Palette Data ..... WO**

- 31-16 Texel n+1**  
**15-0 Texel n**

An internal counter is used in loading the texture palette. Writing to the Texture register (GEbase+A0) resets the counter to 0. Writing to the Texture Palette Data register writes the data to the place pointed to by the counter then increments the counter by 1. Each write writes two entries into the palette.

**GEbase + AC – Texture Boundary ..... RW**

- 31-22 Maximum V**  
**21-12 Minimum V**  
**11-8 Reserved** .....always reads 0  
**7 Reverse Texture Format**  
0 Disable  
1 Enable
- 6 Texture Cache**  
0 Disable  
1 Enable
- 5 Texture Map Shift**  
0 Disable  
1 Enable
- 4-3 Compressed Texture Format**  
00 No compression  
01 DXT1 format  
10 DXT2 format  
11 -reserved-
- 2-0 Dither Shift**  
000 Disable LOD dithering  
001 100% LOD dithering  
010 80% LOD dithering  
011 60% LOD dithering  
100 40% LOD dithering  
101 20% LOD dithering  
11x -reserved-

**Texture Filtering**

Texture data read back from the Memory Interface first goes through palette translation if the texture is palettized. The texture is then converted into common internal 8888 ARGB format. If the texture doesn't have alpha data, then a constant alpha value is used. If the texture color key is enabled and the texture color matches the key, set alpha to 0. Bi-linear or tri-linear filtering is then performed on RGB and alpha. If the color key is enabled and the result alpha is 0, the corresponding pixel should be discarded. This is done by attaching a validity bit with texture data passed from the Texture Engine to the Data Path. It should be noted that filtering depends on the LOD value. When LOD < 0, a different filter may be applied. In bi-linear filtering, if the texel nearest to the texture coordinate is masked by the color key, then the texel is considered as masked. Otherwise, the texel is considered not masked.

## Memory Interface Registers

The registers in this group include stride and buffer base address registers for frame buffer control. There are three base addresses: source base address (added to blt source), destination base address (added to color destination), and Z base address (added to Z addresses).

**GEbase + B8 – Destination Stride / Buffer Base 0 .... RW**

**GEbase + BC – Destination Stride / Buffer Base 1 ... RW**

**GEbase + C0 – Destination Stride / Buffer Base 2 .... RW**

**GEbase + C4 – Destination Stride / Buffer Base 3 .... RW**

**GEbase + C8 – Source Stride / Buffer Base 0 ..... RW**

**GEbase + CC – Source Stride / Buffer Base 1 ..... RW**

**GEbase + D0 – Source Stride / Buffer Base 2 ..... RW**

**GEbase + D4 – Source Stride / Buffer Base 3 ..... RW**

All eight of the above registers have the same bit definitions:

<b>31-29</b>	<b>Bits Per Pixel</b>
	000 8 bits per pixel
	001 16 bits per pixel (565 format)
	010 32 bits per pixel
	011 -reserved-
	100 -reserved-
	101 16 bits per pixel (555 format)
	11x -reserved-
<b>28-20</b>	<b>Stride</b> (pixels divided by 8)
<b>19-0</b>	<b>Buffer Base Address</b> (in quadwords)

**GEbase + D8 – Z Depth / Z Buffer Base ..... RW**

<b>31-30</b>	<b>Z Depth</b>
	00 16 bits
	01 24 bits (32 bits are allocated in the frame buffer with the MSB not used)
	1x -reserved-
<b>29</b>	<b>Reserved</b> .....always reads 0
<b>28-20</b>	<b>Z Stride</b>
<b>19-0</b>	<b>Z Buffer Base Address</b> (in quadwords)

There are 9 texture base registers for up to 9 levels of MipMaps: level 0 (1:1 map) up to level 8 (smallest). The texture may be in the frame buffer or in system memory.

**GEbase+DC – Texture Base MipMap Level 0 (1:1 Map)RW**

**GEbase + E0 – Texture Base MipMap Level 1 ..... RW**

**GEbase + E4 – Texture Base MipMap Level 2 ..... RW**

**GEbase + E8 – Texture Base MipMap Level 3 ..... RW**

**GEbase + EC – Texture Base MipMap Level 4 ..... RW**

**GEbase + F0 – Texture Base MipMap Level 5 ..... RW**

**GEbase + F4 – Texture Base MipMap Level 6 ..... RW**

**GEbase + F8 – Texture Base MipMap Level 7 ..... RW**

**GEbase+FC – Texture Base MipMap Level 8 (Smallest)RW**

All nine of the above registers have the same bit definitions:

<b>31-0</b>	<b>Texture Base Address</b> (in bytes)
	Base addresses always start on QWORD boundaries so bits 2-0 are always 0.

## Data Port Area

**GEbase + 10000-1FFFFh – Data Port Area ..... RW**

**CyberBlade™ i7**
