VIA VT8601 APOLLO PROMEDIA

66 / 100 / 133 MHz Single-Chip Slot-1 / Socket-370 PCI North Bridge, With Integrated AGP 2D / 3D Graphics Accelerator and Advanced Memory Controller supporting PC100 / PC133 and VCM SDRAM For Desktop PC Systems

General

- 510 BGA Package (35mm x 35mm)
- 2.5 Volt core with 3.3V CMOS I/O
- Supports GTL+ I/O buffer Host interface
- Supports separately powered 5.0V tolerant interface to PCI bus and Video interface
- 2.5V, 0.25um, high speed / low power CMOS process
- PC98 / 99 compatible using VIA VT82C686A (352-pin BGA) south bridge chip for Desktop and Mobile
 applications
- 66 / 100 / 133 MHz CPU Front Side Bus (FSB) Operation

High Integration

- Single chip implementation for 64-bit Slot-1 and Socket-370 CPUs, 64-bit system memory, 32-bit PCI with integrated 2D / 3D GUI accelerator
- Apollo ProMedia Chipset: VT8601 system controller and VT82C686A PCI to ISA bridge
- Chipset includes dual UltraDMA-33/66 EIDE, AC-97 link, 4 USB ports, integrated Super-I/O, hardware monitoring keyboard / mouse interfaces, and RTC / CMOS

• High Performance CPU Interface

- Supports Slot-1Intel Pentium II[™] / Pentium III[™] and Socket-370 Celeron[™] processors
- 66 / 100 / 133 MHz CPU Front Side Bus (FSB)
- Built-in PLL (Phase Lock Loop) circuitry for optimal skew control within and between clocking regions
- Five outstanding transactions (four In-Order Queue (IOQ) plus one input latch)
- Supports WC (Write Combining) cycles
- Dynamic deferred transaction support
- Sleep mode support
- System management interrupt, memory remap and STPCLK mechanism

| CPU | DRAM | GUI Core | Internal AGP | PCI | Comments |
|---------|---------|----------|--------------|--------|--|
| 133 MHz | 133 MHz | 100 MHz | 66 MHz | 33 MHz | Synchronous (DRAM uses CPU clock) |
| 133 MHz | 100 MHz | 100 MHz | 66 MHz | 33 MHz | Pseudo-synchronous (DRAM uses GUI clock) |
| 100 MHz | 133 MHz | 100 MHz | 66 MHz | 33 MHz | Pseudo-synchronous (DRAM uses GUI clock) |
| 100 MHz | 100 MHz | 100 MHz | 66 MHz | 33 MHz | Synchronous (DRAM uses CPU clock) |
| 100 MHz | 66 MHz | 66 MHz | 66 MHz | 33 MHz | Pseudo-synchronous (DRAM uses GUI clock) |
| 66 MHz | 100 MHz | 100 MHz | 66 MHz | 33 MHz | Pseudo-synchronous (DRAM uses GUI clock) |
| 66 MHz | 66 MHz | 66 MHz | 66 MHz | 33 MHz | Synchronous (DRAM uses CPU clock) |

• Internal Accelerated Graphics Port (AGP) Controller

- AGP v1.0 compliant
- Pipelined split-transaction long-burst transfers up to 533 MB/sec
- Eight level read request queue
- Four level posted-write request queue
- Thirty-two level (quadwords) read data FIFO (128 bytes)
- Sixteen level (quadwords) write data FIFO (64 bytes)
- Intelligent request reordering for maximum AGP bus utilization
- Supports Flush/Fence commands
- Graphics Address Relocation Table (GART)
- One level TLB structure
- Sixteen entry fully associative page table
- LRU replacement scheme
- Independent GART lookup control for host / AGP / PCI master accesses
- Windows 95 OSR-2 VXD and integrated Windows 98 / NT5 miniport driver support

Concurrent PCI Bus Controller

- PCI bus is synchronous / pseudo-synchronous to host CPU bus
- 33 MHz operation on the primary PCI bus
- Supports up to five PCI masters
- Peer concurrency
- Concurrent multiple PCI master transactions; i.e., allow PCI masters from both PCI buses active at the same time
- Zero wait state PCI master and slave burst transfer rate
- PCI to system memory data streaming up to 132Mbyte/sec
- PCI master snoop ahead and snoop filtering
- Six levels (double-words) of CPU to PCI posted write buffers
- Byte merging in the write buffers to reduce the number of PCI cycles and to create further PCI bursting possibilities
- Enhanced PCI command optimization (MRL, MRM, MWI, etc.)
- Forty-eight levels (double-words) of post write buffers from PCI masters to DRAM
- Sixteen levels (double-words) of prefetch buffers from DRAM for access by PCI masters
- Supports L1/L2 write-back forward to PCI master read to minimize PCI read latency
- Supports L1/L2 write-back merged with PCI master post-write to minimize DRAM utilization
- Delay transaction from PCI master reading DRAM
- Read caching for PCI master reading DRAM
- Transaction timer for fair arbitration between PCI masters (granularity of two PCI clocks)
- Symmetric arbitration between Host/PCI bus for optimized system performance
- Complete steerable PCI interrupts
- PCI-2.2 compliant, 32 bit 3.3V PCI interface with 5V tolerant inputs

• Advanced High-Performance DRAM Controller

- DRAM interface synchronous or pseudosynchronous with CPU FSB speed of 66 / 100 / 133 MHz
- DRAM interface may be <u>faster</u> than CPU by 33 MHz to allow use of PC100 with 66 MHz Celeron CPU or use of PC133 with 100 MHz Pentium II or Pentium III CPU
- DRAM interface may be <u>slower</u> than CPU by 33 MHz to allow use of older memory modules with a newer CPU
- Concurrent CPU, AGP, and PCI access
- Supports FP, EDO, SDRAM and VCM-SDRAM memory types
- Different DRAM types may be used in mixed combinations
- Different DRAM timing for each bank
- Dynamic Clock Enable (CKE) control for SDRAM power reduction in high speed systems
- Mixed 1M / 2M / 4M / 8M / 16M / 32MxN DRAMs
- 6 banks DRAMs supported up to 1GB (256Mb DRAM technology)
- Flexible row and column addresses
- 64-bit data width only
- 3.3V DRAM interface with 5V-tolerant inputs
- Programmable I/O drive capability for MA, command, and MD signals
- Two-bank interleaving for 16Mbit SDRAM support
- Two-bank and four bank interleaving for 64Mbit SDRAM support
- Supports maximum 8-bank interleave (i.e., 8 pages open simultaneously); banks are allocated based on LRU
- Independent SDRAM control for each bank
- Seamless DRAM command scheduling for maximum DRAM bus utilization (e.g., precharge other banks while accessing the current bank)
- Four cache lines (16 quadwords) of CPU to DRAM write buffers
- Four cache lines of CPU to DRAM read prefetch buffers
- Read around write capability for non-stalled CPU read
- Speculative DRAM read before snoop result
- Burst read and write operation
- x-2-2-2-2-2 back-to-back accesses for EDO DRAM from CPU or from DRAM controller
- x-1-1-1-1-1 back-to-back accesses for SDRAM
- BIOS shadow at 16KB increment
- Decoupled and burst DRAM refresh with staggered RAS timing
- CAS before RAS or self refresh

• General Graphic Capabilities

- 64-bit Single Cycle 2D/3D Graphics Engine
- Supports 2 to 8 Mbytes of Frame Buffer
- Real Time DVD MPEG-2 and AC-3 Playback
- Video Processor
- I²C Serial Interface
- Integrated 24-bit 230MHz True Color DAC
- Extended Screen Resolutions up to 1600x1200
- Extended Text Modes 80 or 132 columns by 25/30/43/60 rows
- DirectX 6 and OpenGL ICD API

• Graphics Performance

- Sustained 1M polygons/second and 100M pixels/second
- 30fps DVD playback of 9.8Mbps MPEG-2 video with 30% headroom
- Host Based AC-3 decode at only 8% utilization

• High Performance rCADE3D™ Accelerator

- 32 entry command queue, 32 entry data queue
- 4Kbyte texture cache with over 90% hit rates
- Pipelined Single Cycle Setup/Texturing/Rendering Engines
- DirectDrawTM acceleration
- Multiple buffering and page flipping

Setup Engine

- 32-bit IEEE floating point input data
- Slope and vertex calculations
- Back facing triangle culling
- 1/16 sub-pixel positioning

Rendering Engine

- High performance single pass execution
- Diffused and specula lighting
- Gouraud and flat shading
- Anti-aliasing including edge, scene, and super-sampling
- OpenGL compliant blending for fog and depth-cueing
- 16-bit Z-buffer
- 8/16/32 bit per pixel color formats

Texturing Engine

- 1/2/4/8-bits per pixel compact palletized textures
- 16/32-bits per pixel quality non-palletized textures
- Pallet formats in ARGB 565, 1555, or 444
- Tri-linear, bi-linear, and point-sampled filtering
- Mip-mapping with multiple Level-Of-Detail (LOD) calculations and perspective correction
- Color keying for translucency

2D GUI Engine

- 8/15/16/24/32-bits per pixel color formats
- 256 Raster Operations (ROPs)
- Accelerated drawing: BitBLTs, lines, polygons, fills, patterns, clipping, bit masking
- Panning, scrolling, clipping, color expansion, sprites
- 32x32 and 64x64 Hardware Cursor
- DOS graphics and text modes

DVD

- Hardware-Assisted MPEG-2 Architecture for DVD with AC-3
- Simultaneous motion compensation and front-end processing (parsing, decryption and decode)
- Supports full DVD 1.0, VCD 2.0 and CD-Karaoke
- Microsoft DirectShow 3.0 native support, backward compatible to MCI
- No additional frame buffer requirements
- Sub-picture hardware eliminates Run-Length-Decoder and Alpha Blending overhead
- Dynamic frame and field de-interlace filtering for high quality playback on VGA monitors (Bob and Weave)
- Tamper-proof software CSS implementation
- Freeze, Fast-Forward, Slow Motion, Reverse
- Pan-and-Scan support for 16:9 sequence

Video Processor

- On-chip Color Space Converter (CSC)
- Anti-tearing via two frame buffer based capture surfaces
- Minifier for video stream compression and filtering
- Horizontal/vertical interpolation with edge recovery
- Dual frame buffer apertures for independent memory access for graphics and video
- YUV 4:2:2/4:1:1/4:2:0 and RGB formats
- Video Module Interface (VMI) to MPEG and video decoder
- Vertical Blank Interval for IntercastTM
- Overlay differing video and graphic color depths
- Minifier Video Module Interface (VMI) to MPEG and video decode
- Display two simultaneous video streams from both internal AGP and VMI
- Two scalers and Color Space Converters (CSC) for independent windows

Flat Panel Interface

- 85MHz Flat Panel interface supports 1024x768 panels
- Support for TFT, STN & DSTN panel technologies
- Allows external LVDS or TMDS transmitter for advanced panel interfaces

Power Management Support

- Dynamic power down of SDRAM (CKE)
- Independent clock stop controls for CPU / SDRAM, AGP, and PCI bus
- PCI and AGP bus clock run and clock generator control
- VTT suspend power plane preserves memory data
- Suspend-to-DRAM and Self-Refresh operation
- EDO self-refresh and SDRAM self-refresh power down
- 8 bytes of BIOS scratch registers
- Low-leakage I/O pads

Testability

Build-in NAND-tree pin scan test capability

SYSTEM OVERVIEW

The Apollo ProMedia is a PC Slot-1 system logic North Bridge with integrated 2D/3D Graphics accelerator. The core logic portion of the chip is based on the VIA Apollo Pro133 with integrated graphics accelerator provided by an industry leading Graphics supplier. The combination of the two leading edge technologies provides a stable, cost-effective, and high performance solution to both the Desktop and Mobile personal computer markets. As shown in Figure 1 below, the Apollo ProMedia will interface to:

- Slot-1 Front-Side Bus (66 133 MHz)
- PC66 / PC100 / PC133 SDRAM Memory Interface
- PCI Bus (30 33 MHz)
- Analog RGB Monitor with DDC
- Various Flat Panels or Digital Monitor Transmitters (TMDS or LVDS)
- Video Capture / Playback CODECs

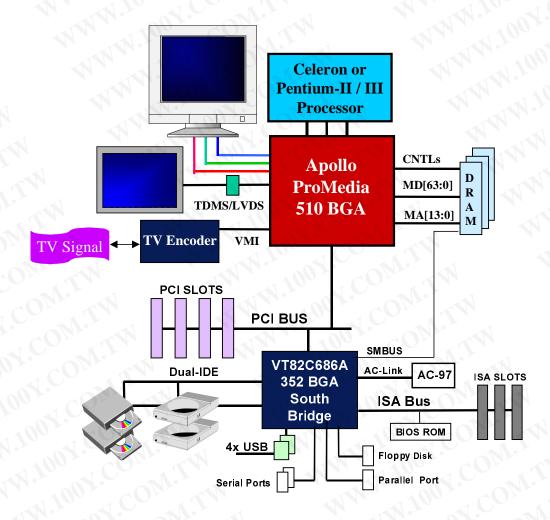

Figure 1: Apollo ProMedia High Level System Diagram

Apollo ProMedia Core Logic Overview

Apollo ProMedia – System Media Accelerated North Bridge (SMA) – is a high performance, cost-effective and energy efficient solution for the implementation of Integrated 2D / 3D Graphics - PCI - ISA desktop and notebook personal computer systems from 66 MHz to 133 MHz based on 64-bit Slot-1 Intel Pentium II, Pentium III, and Celeron processors. The complete solution consists of the Apollo ProMedia controller / "north bridge" (510 BGA) and either the VT82C596B (324 BGA) or the VT82C686A (352 BGA) PCI-to-ISA south bridge. Both south bridges are PC98 / PC99 compliant with integrated UltraDMA-33 / 66 IDE, 4 USB ports, and a complete power management feature set. The VT82C686A also integrates HW monitoring, Super-I/O functions (floppy disk drive interface and serial / parallel ports), and AC-97 link supporting digital audio and HSP modem functions.

Apollo ProMedia supports six banks of DRAMs up to 1GB. The DRAM controller supports standard Fast Page Mode (FP) DRAM, EDO-DRAM, Synchronous DRAM (SDRAM), and Virtual Channel Synchronous DRAM (VC-SDRAM) in a flexible mix / match manner. The Synchronous DRAM interface allows zero wait state bursting between the DRAM and the data buffers at 100 MHz. The six banks of DRAM can be composed of an arbitrary mixture of 1M/2M/4M/8M/16M/32MxN DRAMs. The DRAM Controller is optimized to run synchronous with the CPU Front Side Bus (FSB) frequency of 66 MHz, 100 MHz, or 133 MHz.

The Apollo ProMedia also supports full AGP v1.0 capability with the internal 2D/3D Graphics Engine for maximum software compatibility. An eight level request queue plus a four level post-write request queue with thirty-two and sixteen quadwords of read and write data FIFO's respectively are included for deep pipelined and split AGP transactions. A single-level GART TLB with 16 full associative entries and flexible CPU/AGP/PCI remapping control is also provided for operation under protected mode operating environments. Both Windows-95 VXD and Windows-98 / NT5 miniport drivers are supported.

The Apollo ProMedia supports one 32-bit 3.3 / 5V system bus (PCI) that is synchronous / pseudo-synchronous to the CPU bus. The chip also contains a built-in AGP bus-to-PCI bus bridge to allow simultaneous concurrent operations on each bus. Five levels (doublewords) of post write buffers are included to allow for concurrent CPU and PCI operation. For PCI master operation, forty-eight levels (doublewords) of post write buffers and sixteen levels (doublewords) of prefetch buffers are included for concurrent PCI bus and DRAM/cache accesses. The chip also supports enhanced PCI bus commands such as Memory-Read-Line, Memory-Read-Multiple and Memory-Write-Invalid commands to minimize snoop overhead. In addition, advanced features are supported such as snoop ahead, snoop filtering, L1 / L2 write-back forward to PCI master, and L1 / L2 write-back merged with PCI post write buffers to minimize PCI master read latency and DRAM utilization. Delay transaction and read caching mechanisms are also implemented for further improvement of overall system performance.

For sophisticated notebook implementations, the Apollo ProMedia provides independent clock stop control for the CPU / SDRAM, PCI, and AGP buses and Dynamic CKE control for powering down of the SDRAM. A separate suspend-well plane is implemented for the SDRAM control signals for Suspend-to-DRAM operation. Coupled with the 324-pin Ball Grid Array VIA VT82C596A south bridge chip, a complete notebook PC main board can be implemented with no external TTLs.

Apollo ProMedia Graphics Controller Overview

The Apollo ProMedia Graphics Controller is a highly integrated display control device that incorporates a 64-bit 3D/2D graphic engine and video accelerator with advanced DVD video and optional TV output capability. It provides a flexible and high performance solution for graphics and video playback acceleration for various color depth and resolution modes.

The Apollo ProMedia Graphics Controller supports a video capture port to import captured live MPEG 1 or MPEG 2 video streams, or DVD decompressed video streams to be overlaid with a graphics stream of mixed color depth displays. In supporting dual live videos, the Apollo ProMedia Graphics Controller offers independent dual video windows ready for videoconferencing and with linear scaling capability.

Integrating the programmable phase lock loop with high speed LUT DACs, the Apollo ProMedia Graphics Controller is a true price/performance solution for the modern multimedia based entertainment PC.

Capability Overview

The Apollo ProMedia Graphics Controller is a fully integrated CRT and TV 64-bit 2D/3D Accelerator. The high performance graphics engine offers high speed 3D image processing in full compliance and compatibility with IBM® VGA and VESATM extended VGA. As an integrated controller, it allows unprecedented cost and performance advantages by eliminating the need for an external frame buffer while at the same time gaining local access to a larger amount of memory. Many functions can now be eliminated that previously consumed large amounts of bandwidth.

The Apollo ProMedia Graphics Controller, equipped with a single-cycle 3D GUI Engine, pipelines 3D rendering process architecture in hardware, providing real-time interactions with solid 3D models in CAD/CAM, 3D modeling, and 3D games. It supports all key 3D rendering operations, including: Gouraud shading for smooth object surfaces, texture mapping for realistic object textures, 16-bit hardware Z-buffering for fast 3D depth calculations, and Alpha Blending for transparency effects.

The Apollo ProMedia Graphics Controller's highly innovative design, a full 64-bit memory interface with a high performance graphics engine which can support a RAMDACTM running up to 230MHz, dramatically improves GUI functions and significantly promotes overall system operation.

The Apollo ProMedia Graphics Controller supports a full AGP implementation internally to remain compatible with existing software and programming models. However, since the engine is integrated it enjoys a higher bandwidth and lower latency than is possible with discrete solutions. AGP operations can include direct access of the system memory by the 2D/3D engine to provide increased texture memory.

To meet the requirements of a PC99 graphics adapter in a multimedia PC, the Apollo ProMedia Graphics Controller supports planar video format for MPEG-1, MPEG-2, and DVD-video playback. The dual video playback is capable of overlaying windows for videoconferencing and multimedia displays. Advanced features of the Apollo ProMedia Graphics Controller, such as color space conversion, video scaling, dual video windows, dual-view display, Video Module Interface (VMI), Vertical Blanking Interleave (VBI), a 24-bit True Color DAC, and triple clock synthesizers allow performance at peak levels.

By using an extended 16-bit VMI port the Apollo ProMedia Graphics Controller can support DTV resolution. This port can operate as either an input for Video Capture or as an output for Video display. The Apollo ProMedia Graphics Controller is capable of supporting three simultaneous displays: CRT, Flat Panel & Video, each with a different "window" or desktop.

Apollo ProMedia Graphics Controller supports a rich featured flat panel interface that can be used to directly control a flat panel device. Alternatively, it can drive an LVDS or TMDS transmitter to support the latest Flat Panel displays requiring these interfaces.

System Capabilities

The Apollo ProMedia Graphics Controller's main system features include:

- High Performance single cycle GUI
- Highly Integrated RAMDACTM and Triple Clock Synthesizer
- Full Feature High Performance 3D Graphics Engine
- High speed internal AGP Bus Mastering data bus supporting DVD video playback & 3D
- Hardware implementation of motion compensation
- Dual Video Windows for Videoconferencing
- TrueVideo® Processor
- DirectDrawTM and DirectVideoTM Hardware Support
- Versatile Motion Video Capture/Overlay/Playback Support
- Flexible Frame Buffer Memory Interface
- Advanced Mobile Power Management
- CRT Power Management (VESATM DPMS)
- PC99 Hardware Support

High Performance 64-bit 2D GUI

The 64-bit graphics engine of the Apollo ProMedia Graphics Controller significantly improves graphics performance through specialized hardware that accelerates the most frequently used GUI operations and matches the high-speed requirements of CPUs. Functions directly supported in hardware include: BitBLTs, image and text transfer, line draw, short stroke vector draw, rectangle fills, and clipping. The graphics engine supports 256 Raster Operations (ROPs) for up to 32-bit packed pixel graphic modes. The ROP3 Processor in the Apollo ProMedia Graphics Controller is able to perform Boolean functions which allow many additional operations, including transparency, pattern masking, color expansion alignment, and pattern enhancement. Additionally, the graphics engine features linear display memory addressing (up to 4GB memory space), accelerated color expansion modes for graphics text procession, and memory-mapped I/O registers on the graphics engine for faster access time.

Graphic functions are optimized by a 64-bit internal data bus and a four-color hardware cursor/pop-up icon, operating up to a 128x128x2 pixel image, which offloads the CPU. The hardware cursor mechanism can also be used to display patterns stored in the system memory. This pop-up icon is very useful to display user friendly information instantly through simple hot key operations. This advanced function combination allows significant performance increases over standard Super VGA designs and provides outstanding graphics acceleration on GUIs, such as Microsoft® Windows 98®.

Highly Integrated RAMDACTM & Clock Synthesizer

The highly integrated design of the Apollo ProMedia Graphics Controller offers a "no TTL" solution for cost-effective, high-performance multimedia subsystem designs for the PC and compatible notebooks. The 64-bit memory data bus supporting SDRAM and SGRAM memory provides faster data transfer rates for improved system throughput. The Apollo ProMedia Graphics Controller has a built-in, high speed RAMDACTM. The RAMDACTM is composed of one 256x24 and one 256x18 color lookup table and a triple loop frequency synthesizer, providing the read/write timing control for the Frame Buffer Memory and the refresh of the TV/CRT display.

The integrated frequency synthesizer provides a 125MHz memory clock for high speed DRAM access and a 230MHz video clock which supports various refresh rates up to 85Hz at 1280x1024.

Full Feature High Performance 3D Engine

The Apollo ProMedia Graphics Controller is equipped with an advanced Graphics Drawing, Single Cycle 3D Graphics Engine that performs premium 3D functions at a high level of more than 1M triangles per second. The 3D engine supports Microsoft® Direct3D. The 3D Engine is set up to off-load the CPU from major 3D tasks including slope calculation, sub-pixel positioning, and Tri-striping. By balancing the 3D pipeline and reducing parameter passing, the Apollo ProMedia Graphics Controller provides very high levels of performance. The 3D engine is integrated with a triangle set-up engine that sets up triangles according to vertex input data and accomplishes various functions for 3D rendering. Gouraud shading provides smooth shading for colors across surfaces, perspective correction texture mapping to correct texture data based on the perspective, bi-linear texture filtering for interpolating, alpha blending to compensate colors for the opacity of two colors blended, Z-buffering (16-bit/24-bit), video texturing to overlay 2D video play-back onto 3D images, fogging to simulate weather effects, palletized texture mapping (1-

, 4-, or 8-bit) for memory and bandwidth reduction, and anti-aliasing to reduce or eliminate jaggies resulted from alias rendering. The 3D engine also works with the APM system, conserving power while 3D operations are suspended.

Video Processor

Video processor features include: on-chip hardware Color Space Conversion (CSC) for faster data conversion on the fly, Horizontal/Vertical (H/V) scaling with interpolation, edge recovery algorithm logic, gamma correction, and overlay control with different color depths from graphics. The Apollo ProMedia Graphics Controller also includes a fully integrated GUI accelerator, read cache, and command FIFO that optimize memory bandwidth and maximize graphics performance.

The Apollo ProMedia Graphics Controller, with an integrated Video Display and a Capture Engine, supports dual apertures on the PCI bus which enables independent graphic and video data to be transported simultaneously to and from different memory areas and greatly accelerates the performance of both DirectDraw[™] and DirectVideo[™]. The Apollo ProMedia Graphics Controller can provide dual video windows that display different images from different video sources (from the PCI bus and from the capture port) on the same screen. The video image is stored in off-screen memory and is retrieved by the Video Display Processing block for video processing. With the help of DirectDraw[™] acceleration for sprites, page flipping, double buffering, and color keying, video processing is performed by utilizing a proprietary edge recovery algorithm for sharper line visibility, de-interlacing, antitearing, multitap horizontal filtering, dithering, and scaling operations with bilinear interpolation in both horizontal and vertical directions. Linear scaling permits zoom in/out to any size without any restrictions. In addition, the on-chip hardware Color Space Conversion (CSC) accelerates conversion for 16 bit YUV pixels into linear true color 32 bit RGB pixels on the fly. The additional X and Y minifiers are capable of shrinking video images to any linear fractions, which saves bus bandwidth and memory space. The YUV planar logic of the Apollo ProMedia Graphics Controller supports a YUV 420 format that can eliminate redundant video stream decoding procedures. The load of the CPU is reduced while performing software MPEG or software video conferencing. The color and luminance control provided by the Apollo ProMedia Graphics Controller offers color compensations to prevent color distortion for display devices such as a CRT or TV with Gamma correction and hue adjustment control.

The Video Conferencing feature allows remote and local video images to be displayed simultaneously on the same screen.

Video Capture and DVD

The Apollo ProMedia Graphics Controller has a Video Module Interface (VMI) and advanced hardware interface logic allowing it to be directly connected to many MPEG and video decoders such as the C-Cube CL450/480, SGS 3400/3500, Philips 7110/1 and Brooktree BT819/817/827/829.

The Apollo ProMedia Graphics Controller, integrated with a DVD video hardware block for motion compensation, gives existing PCs the ability to play DVD video in MPEG-2 format at high bandwidths with very good video quality.

A new industry standard is being set for transmission of non-video data over a TV broadcast signal during vertical blanking dead time. This technology is referred to as Intercast. The Apollo ProMedia Graphics Controller has the ability to take the entire video stream over the video port, sending the visible video stream to the display memory for display in a window, stripping the VBI data from the stream, and then sending this data to the CPU for processing using PCI Bus Mastering.

Versatile Frame Buffer Interface

The Apollo ProMedia Graphics Controller features a versatile frame buffer interface appearature into main system memory. Optimized performance can be achieved with the single cycle memory bus interface using programmable DRAM timing. The display queue has been increased to reduce the frequency of memory bus requests, optimizing memory bus efficiency for the graphic controller.

With the support of the internal AGP apperature, the Apollo ProMedia Graphics Controller has access to system memory through the GART. In the execute mode, the Apollo ProMedia Graphics Controller is able to use both the dedicated graphics portion and the general portion of system memory for graphics operations. As a result, DVD and 3D rendering performance and quality are greatly enhanced.

Hi-Res and Hi-Ref Display Support

Apollo ProMedia Graphics Controller display enhancements dramatically improve CRT resolution. These enhancements include support of non-interlaced 1280x1024x64K, 1024x768x16M, 800x600x16M, and 640x480x16M colors for "full spectrum" color. Extended text modes of 80 or 132 columns by 25, 30, 43, or 60 rows provide an extended graphics area frequently used in many spreadsheet and database applications. Extended graphics and text modes are supported by software drivers that provide a "ready-to-go" solution, minimizing the need for additional driver development.

A virtual screen can be created with the Apollo ProMedia Graphics Controller. When this function is enabled, a selected portion of a large image can be shown on a smaller display. The image can also be moved across the whole screen, either up or down.

The Apollo ProMedia Graphics Controller is able to automatically detect DDC monitors with I²C signaling.

CRT Power Management (VESA DPMS)

The Apollo ProMedia Graphics Controller conforms to the standard power management schemes defined by VESATM for CRTs. The Apollo ProMedia Graphics Controller supports four states of VESATM Display Power Management Signaling (DPMS), which decrease monitor power consumption after timeout periods. VESATM DPMS power down states (ready, standby, suspend, and off) specify HSYNC and VSYNC signals to control the monitor power down state.

Flat Panel Interface

The Apollo ProMedia Flat Panel interface is designed to support industry standard TFT and STN panels. It can also be used to drive external TMDS or LVDS transmitters. The interface supports both 18-bit and 24-bit display modes. Optionally, an 18+18 panel can be supported utilizing external latches.

Video Capture Interface

The Video Module Interface (VMI) is supported for video devices such as MPEG1 and MPEG2. Additionally, the zero-wait state host write buffer, read cache, and memory mapped I/O increase operating speeds and contribute to peak performance levels. All I/O interfaces are 5V tolerant, capable of interfacing with external devices operating at 5V, even though the Apollo ProMedia Graphics Controller runs at 2.5V. Graphics system throughput is further enhanced by a command FIFO, allowing maximum bus transfer speed for applications such as WindowsTM or AutoCADTM that directly access video memory.

Complete Hardware Compatibility

The Apollo ProMedia Graphics Controller is fully compliant with the VESATM DDC and VAFC standards. The Apollo ProMedia Graphics Controller is 100% VGA compatible at both the BIOS and Driver level, allowing full compatibility with virtually any VGA application software. The Apollo ProMedia Graphics Controller provides hardware support to DirectDrawTM, offering high speed game graphics on Windows 98[®]. The Apollo ProMedia Graphics Controller meets the requirements of PC99 as well, supporting a unique ID for each customer and a unique ID for each model.

PIN DESCRIPTIONS

Table 1. VT8601 Pin Descriptions

| | 1007 | <u>~0</u> 1 | CPU Interface |
|-------------|-------------------------------|-------------|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description |
| HA[31:3]# | see pin list | IO | Host Address Bus. Connect to the address bus of the host CPU. These pins are inputs during CPU cycles, but are driven by the VT8601 during cache snooping operations. |
| HD[63:0]# | see pin list | IO | Host CPU Data. These signals are connected to the CPU data bus. |
| ADS# | J24 | IO | Address Strobe. The CPU asserts ADS# in T1 of the CPU bus cycle. |
| BNR# | D26 | Ю | Block Next Request . Used to block the current request bus owner from issuing new requests. This signal is used to dynamically control the processor bus pipeline depth. |
| BPRI# | E26 | Ю | Priority Agent Bus Request . The owner of this signal will always be the next bus owner. This signal has priority over symmetric bus requests and causes the current symmetric owner to stop issuing new transactions unless the HLOCK# signal is asserted. The VT82C693 drives this signal to gain control of the processor bus. |
| DBSY# | H26 | IO | Data Bus Busy . Used by the data bus owner to hold the data bus for transfers requiring more than one cycle. |
| DEFER# | F26 | IO | Defer . The VT8601 uses a dynamic deferring policy to optimize system performance. The VT8601 also uses the DEFER# signal to indicate a processor retry response. |
| DRDY# | J23 | IO | Data Ready. Asserted for each cycle that data is transferred. |
| HIT# | G24 | IO | Hit . Indicates that a cacheing agent holds an unmodified version of the requested line. Also driven in conjunction with HITM# by the target to extend the snoop window. |
| HITM# | G26 | I | Hit Modified . Asserted by the CPU to indicate that the address presented with the last assertion of EADS# is modified in the L1 cache and needs to be written back. |
| HLOCK# | G23 | I | Host Lock . All CPU cycles sampled with the assertion of HLOCK# and ADS# until the negation of HLOCK# must be atomic. |
| BREQ0# | J25 | О | Bus Request 0. Bus request output to CPU. |
| HREQ[4:0]# | E25, F25, F24, F23, E24 | Ю | Request Command . Asserted during both clocks of the request phase. In the first clock, the signals define the transaction type to a level of detail that is sufficient to begin a snoop request. In the second clock, the signals carry additional information to define the complete transaction type. |
| HTRDY# | G25 | IO | Host Target Ready . Indicates that the target of the processor transaction is able to enter the data transfer phase. |
| RS[2:0]# | H25, K23, H23 | IO | Response Signals. Indicates the type of response per the table below:RS[2:0]#Response type000Idle State001Retry Response010Defer Response011Reserved100Hard Failure101Normal Without Data110Implicit Writeback111Normal With Data |
| CPURST# | A19 | 0 | CPU Reset. Reset output to CPU |
| CPURSTD# | E22 | 0 | CPU Reset Delayed. CPU Reset output delayed by 2T. |

Note: Clocking of the CPU and cache interfaces is performed with HCLK; see the clock pin group at the end of the pin descriptions section for descriptions of the clock input pins.

Note: All signals above require 4.7K pullups to VCC3 except EADS#, HITM#, AHOLD, HA, and HD.

Note: All signals above connect directly to the host CPU except HA and HD which connect directly to the L2 cache SRAMs and connect to the host CPU through 22 ohm series resistors (see the "Apollo ProMedia Design Guide" for more information).

| | | \mathbf{D} | RAM Interface |
|---|---|--------------|--|
| Signal Name | Pin# | I/O | Signal Description |
| MD[63:0] | see pin list | Ю | Memory Data. These signals are connected to the DRAM data bus. Note: MD0 is internally pulled up for use in EDO memory type detection. |
| MA[14:0] / Strap Options | AF25, AE25, AE24, AD24, AE26, AD25, AD26, AC24, AC25, AC26, AB24, AB25, AB26, AB23, AA23 | | Memory Address. DRAM address lines. These pins are also used for power-up strapping options (sampled on the rising edge of RESET#):MA14,12Rx68[1-0]CPU FSB Freq (0=66, 1=100, 2=auto, 3=133)MA13Rx52[7]GTL I/O Buffer Pullup (0=Disable, 1=Enable)MA11In-order Queue Depth (0=1-level, 1=4-level)MA10-9North Bridge Clock Delay (0-3 Clocks)MA8, 6Graphics Clock Select (0=Normal, 1-3=Test)MA7Graphics Test Mode (0=Normal, 1=Test)MA5LCD Output (0=Off, 1=On)MA4-2Panel Type (0-3=TFT, 4-7=DSTN)MA1-0Graphics Clock Delay (0-3 Clocks)All pins have internal pull-downs for default low (0).Strap 1 using 4.7KΩ TO VCC3. |
| CKE5# / SRASB#, CKE4# / SRASC#, CKE3# / SCASB#, CKE2# / SWEB#, CKE1# / SCASC#, CKE0# / SWEC# | AA25, AA26, V25, U25, V24, U26 | NO NO | SDRAM Clock Enable. Clock enables 5-0 may be connected to the DRAM modules in any order. Each DRAM module requires 2 clock enables. Note: These pins are powered by VSUS |
| RAS[5-0]# / CS[5-0]# | W21, Y22, Y23, Y24, Y25, Y26 | 0 | Multifunction Pins 1. FPG/EDO DRAM: Row Address Strobe of each bank. 2. Synchronous DRAM: Chip select of each bank. Note: These pins are powered by VSUS. |
| CAS#[7:0] / DQM[7:0] | AF23, AD23, W25, W26, AE23, AF24, W23, V23 | 0 | Multifunction Pins 1. FPG/EDO DRAM: Column Address Strobe of each byte lane. 2. Synchronous DRAM: Data mask of each byte lane. Note: These pins are powered by VSUS. |
| SRASA#, SRASB# / CKE5, SRASC# / CKE4 | AA24, AA25, AA26 | 0 | Row Address Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). |
| SCASA#, SCASB# / CKE3 SCASC# / CKE1 | U22, V25, V24 | 0 | Column Address Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). |
| SWEA# / MWEA#, SWEB# / MWEB# / CKE2, SWEC# / MWEC# / CKE0 | U24, U25, U26 | 0 | Write Enable Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). Multifunction pins, used as MWE# pins for FPG/EDO memory. "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). Note: These pins are powered by VSUS. |

Note: Clocking of the memory subsystem uses memory clock (MCLK); see the clock pin group at the end of the pin descriptions section for descriptions of the clock pins.

Note: Connect all memory interface pins except MD to the DRAM modules through 22Ω series resistors (see the Apollo ProMedia Design Guide" for more specific connection details and PCB layout recommendations).

| 1100 | PCI Bus Interface | | | | | | |
|-------------|---|------------|--|--|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | | |
| AD[31:0] | see pin list | IO | Address/Data Bus. The standard PCI address and data lines. The address driven with FRAME# assertion and data is driven or received in following cycles. | | | | |
| CBE[3:0]# | AD7, AD9, AB11, AF12 | IO | Command/Byte Enables. Commands are driven with FRAME# assertion. Byte enables corresponding to supplied or requested data are driven on following clocks. | | | | |
| PAR | AB10 | Ю | Parity. A single parity bit is provided over AD[31:0] and C/BE[3:0]. | | | | |
| FRAME# | AE9 | IO | Frame. Assertion indicates the address phase of a PCI transfer. Negation indicates that one more data transfer is desired by the cycle initiator. $10K\Omega$ pullup to VCC3. | | | | |
| IRDY# | AC10 | Ю | Initiator Ready. Asserted when initiator is ready for data transfer. $10K\Omega$ pullup to VCC3. | | | | |
| TRDY# | AD10 | Ю | Target Ready. Asserted when target is ready for data transfer. $10K\Omega$ pullup to VCC3. | | | | |
| STOP# | AE10 | IO | Stop. Asserted by the target to request the master to stop the current transaction. $10K\Omega$ pullup to VCC3. | | | | |
| DEVSEL# | AB9 | Ю | Device Select. This signal is driven by the ProMedia when a PCI initiator is attempting to access main memory. It is an input when the ProMedia is acting as a PCI initiator. $10K\Omega$ pullup to VCC3. | | | | |
| LOCK# | AE5 | IO | Lock. Used to establish, maintain, and release resource lock. $10K\Omega$ pullup to VCC3. | | | | |
| SERR# | AF10 | IO | System Error. The ProMedia will pulse this signal when it detects a system error condition ($10K\Omega$ pullup to VCC3). | | | | |
| PREQ# | AC15 | I | South Bridge Request. This signal comes from the South Bridge. PREQ# is the South Bridge request for the PCI bus. $10K\Omega$ pullup to VCC3. | | | | |
| PGNT# | AD15 | 0 | South Bridge Grant. This signal driven by the ProMedia to grant PCI access to the South Bridge. $10K\Omega$ pullup to VCC3. | | | | |
| REQ[7:0]# | AD1, AC3, AC2, AF2, AD4, AE4, AD5, AC5 | I | PCI Master Request. PCI master requests for use of the PCI bus. $2.2K\Omega$ pullup to VCC5. | | | | |
| GNT[7:0]# | AE1, AD3, AD2, AE2, AE3, AF3, AF4, AB5 | О | PCI Master Grant. Permission is given to the master to use the PCI bus. $2.2K\Omega$ pullup to VCC3. | | | | |
| INTA# | W5 | О | PCI Interrupt Out. INTA# is an asynchronous active low output used to signal an event that requires handling. It is driven by the integrated graphics controller. | | | | |

Note: Clocking of the PCI interface is performed with PCLK; see the clock pin group at the end of the pin descriptions section for descriptions of the clock input pins.

| 1100 | Clock / Reset Control | | | | | | |
|-------------|-----------------------|------------|--|--|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | | |
| HCLK | G22 | Ī | Host Clock. This pin receives the host CPU clock. This clock is used by all logic in the host CPU domain. It is driven by the external clock synthesizer. | | | | |
| MCLKI | K22 | I | Memory Clock In. This clock is used by internal clock logic to maintain the proper phase relationship with MCLKO. It is driven by the external clock synthesizer. | | | | |
| MCLKO | J22 | 0 | Memory Clock Out. Created on-chip from MCLKI and used by the memory controll as a timing reference for creation of all memory timing sequences. It is connected to the external clock chip for use in maintaining proper phase relationships. | | | | |
| PCLK | AB15 | 100 | PCI Clock. This clock is used by all on-chip logic in the PCI clock domain. This must be 33 MHz maximum to comply with PCI specification requirements and m synchronous with the host CPU clock (HCLK) with an HCLK:PCLK frequency r. 2:1 (66MHz CPU clock) or 3:1 (100 MHz CPU clock). The PCI clock needs controlled to within 1.5 ± 0.5 nsec relative to the host CPU clock (CPU leads). | | | | |
| PCKRUN# | AF15 | Ю | PCI Clock Run . For implementation of PCI bus clock control for low-power PCI be operation. Refer to the "PCI Mobile Design Guidelines" and "Apollo ProMedia Design Guide" documents for additional information. | | | | |
| XLTI | Y4 | I | Crystal Input. 14.31818 MHz for the video clock synthesizer reference. Connect 14.31818 MHz clock source if a crystal not used. Connect to main ground plane C with 10Pf if using a crystal. | | | | |
| XLTO | W4 | 0 | Crystal Output. 14.31818 MHz for the video clock synthesizer reference. Leave open if a clock source is used instead of a crystal. Connect to main ground plane GND with 10Pf if using a crystal. | | | | |
| RESET# | AE15 | I | Reset. Driven from the South Bridge PCIRST# signal. When asserted (low), this signal resets the ProMedia and sets all register bits to the default value. This signal also connects to the PCI bus (South Bridge RESET drives the ISA bus if implemented). The rising edge of this signal is used to sample all power-up strap options (see memory interface MA pins). | | | | |
| CPURST# | A19 | О | CPU Reset. CPU Reset output to the host CPU. | | | | |
| CPURSTD# | E22 | О | CPU Reset Delayed 2T. Alternate CPU Reset output to the host CPU | | | | |
| PWROK | AD14 | I | Power OK. Connect to South Bridge and Power Good circuitry. | | | | |
| SUST# | AC22 | I | Suspend Status. For implementation of the Suspend-to-DRAM feature. <u>Input logic for this pin is powered by VSUS.</u> Connect to the South Bridge SUST# pin or to a $10K\Omega$ pullup to VSUS if not used. | | | | |
| SUSP | F5 | I | Suspend. Used to put the integrated graphics controller into suspend state Input logic for this pin is powered by VSUS. Connect to South Bridge GPO pin or to a 10 K Ω pullup to VSUS if not used. | | | | |

| Miscellaneous | | | | | | |
|---------------|--------------|------------|---|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | |
| ETST# | F4 | I | Test Mode Enable. 4.7KΩ pullup to VCC3 for normal operation. | | | |
| IMIO | M2 | 0 | IMI Out. Leave open. | | | |
| IMIIN | M3 | I | IMI In. 4.7KΩ pullup to VCC3. | | | |

| 1 100 | CRT Interface | | | | | |
|-------------|---------------|------------|---|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | |
| RED | C2 | A | Red. Red analog output to the CRT. Connect 75Ω load resistor to GNDR (RGB Return) and connect to VGA connector through a series ferrite bead and 10pF capacitors to GNDR on both input and output sides of the bead (see "Apollo ProMedia Design Guide"). | | | |
| GRN | D3 | Α | Green. Green analog output to the CRT. Connect same as RED. | | | |
| BLUE | D2 | Α | Blue. Blue analog output to the CRT. Connect same as RED. | | | |
| HSYNC | E2 | 0 | Horizontal Sync. Digital horizontal sync output to the CRT. Also used (with VSYNC) to signal power management state information to the CRT per the VESA TM DPMS TM standard. Connect to VGA connector through a series 47Ω resistor and 120pF capacitor to ground (see "Apollo ProMedia Design Guide"). | | | |
| VSYNC | E1 | 0 | Vertical Sync. Digital vertical sync output to the CRT. Also used (with HSYNC) to signal power management state information to the CRT per the VESA TM DPMS TM standard. Connect to VGA connector through a series 47Ω resistor and 120 pF capacitor to ground (see "Apollo ProMedia Design Guide"). | | | |
| SDA | F2 | IO | DDC Data/Address. Serial I ² C protocol for VESA TM DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7KΩ pullup. Connect to the VGA connector only (pin 12 of the connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the "Apollo ProMedia Design Guide" for additional information. | | | |
| SCL | F3 | IO | DDC Clock. Serial I^2C protocol for VESA TM DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7K Ω pullup. Connect to the VGA connector only (pin 15 of the VGA connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the "Apollo ProMedia Design Guide" for additional information. | | | |

| 1 COM | | | DFP Interface | 110 |
|-------------|----------------|------------|---|-----|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | |
| PD[23-0] | (see pin list) | (O | Panel Data. Digital pixel data outputs to the panel. | |
| SCLK | G4 | О | Shift Clock. Clock for transferring digital pixel data. | |
| DE | H3 | 0 | Data Enable. Indicates valid data on PD[23-0]. | |
| LP | G5 | 0 | Line Pulse. Digital monitor equivalent of HSYNC. | |
| FLM | G3 | 0 | First Line Marker. Digital monitor equivalent of VSYNC. | |
| EVDD | F1 | 0 | Enable Panel VDD Power. | |
| EVEE | H5 | 0 | Enable Panel VEE Power. | |
| EBLT | G1 | 0 | Enable Panel Backlight. | 1 |

Note: Connect SHFCLK, DE, LP, and FLM to external TMDS transmitters through series 22Ω resistors. See the "Apollo ProMedia Design Guide" for DFP interface design examples and additional information.

| TV Input / Video Interface | | | | | | | |
|--|---|----|---|--|--|--|--|
| Signal Name Pin # I/O Signal Description | | | | | | | |
| VD[15-0] | N4, N1, N2, N5, P4, P3, P2, P5, R3, R1, R4, R2, R5, T1, T2, R6 | IO | Video Capture / Playback Data. | | | | |
| VHS | T3 | IO | Video Horizontal Sync. Connect to TV decoder if used. | | | | |
| VVS | U1 | IO | Video Vertical Sync. Connect to TV decoder if used. | | | | |
| VCLK | U3 | IO | Video Clock. Connect to TV decoder through a series 22Ω resistor. | | | | |

Note: Refer to the "Apollo ProMedia Design Guide" for video interface design examples.

| TV Output Interface | | | | | | | |
|---------------------|--|---|--|--|--|--|--|
| Signal Name | Signal Name Pin # I/O Signal Description | | | | | | |
| TVD[7-0] | 7-0] U2, T6, U4, T5, V3, U5, V2, V1 O TV Output Data. Connect to TV encoder if used. | | | | | | |
| TVHS | V5 | 0 | TV Horizontal Sync. Connect to TV encoder if used. | | | | |
| TVVS | W3 | 0 | TV Vertical Sync. Connect to TV encoder if used. | | | | |
| TVCLK | V4 | О | TV Clock. Connect to TV encoder through a series 22Ω resistor. | | | | |

Note: Refer to the "Apollo ProMedia Design Guide" for TV interface design examples.

| Clock Power / Ground and Filtering | | | | | | |
|------------------------------------|--------------|------------|---|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | |
| VCCA | H21, H22 | P | Power for North Bridge Clock Circuitry (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to GNDA with 0.001Uf and 0.1Uf ceramic and 10Uf tantalum capacitors (see "Apollo ProMedia Design Guide"). | | | |
| GNDA | L21, L22 | P | Ground for North Bridge Clock Circuitry. Connect to main ground plane GND through a ferrite bead. (see "Apollo ProMedia Design Guide"). | | | |
| VCCV1 | W2 | P | Power for Video Clock Synthesizer 1 Analog Circuitry (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to GNDV1 with 0.001Uf and 0.1Uf ceramicand 10Uf tantalum capacitors (see "Apollo ProMedia Design Guide"). | | | |
| GNDV1 | Y1 | P | Ground for Video Clock Synthesizer 1. Connect to main ground plane through a ferrite bead. | | | |
| VLF1 | Y3 | A | Low Pass Filter Capacitor for Video Clock Synthesizer 1. Connect to GNDV1 through a 560Pf capacitor. | | | |
| VCCV2 | Y2 | P | Power for Video Clock Synthesizer 2 Analog Circuitry (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to GNDV2 with 0.001Uf and 0.1Uf ceramic and 10Uf tantalum capacitors (see "Apollo ProMedia Design Guide"). | | | |
| GNDV2 | AA1 | P | Ground for Video Clock Synthesizer 2. Connect to main ground plane through a ferrite bead. | | | |
| VLF2 | AA2 | A | Low Pass Filter Capacitor for Video Clock Synthesizer 2. Connect to GNDV2 through a 560Pf capacitor. | | | |
| PLLTST | K24 | | PLL Test. Pull down with 4.7K resistor for normal operation. | | | |

| RAMDAC Output Power / Ground and Analog Control | | | | | | | | |
|---|--------------|------------|--|--|--|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | | | |
| VCCS | C1 | P | Power for RAMDAC Current Source Circuitry (2.5V \pm 5%). Connect to VCCI brough a ferrite bead and decouple to GNDS with 0.001uF and 0.1uF ceramic and 10uF antalum capacitors (see "Apollo ProMedia Design Guide"). | | | | | |
| GNDS | B1 | P | round for RAMDAC Current Source Circuitry. Connect to main ground plane ough a ferrite bead. | | | | | |
| COMP | E4 | A | ompensation Capacitor. RAMDAC analog control. Connect to VCCS using a 0.1 F capacitor. | | | | | |
| IRSET | E3 | A | RAMDAC Current Set Point Resistor. RAMDAC analog control. Connect to GNDS prough a 360Ω 1% resistor. | | | | | |
| GNDRGB | Alo | P | RGB Video Output Return. Connection point for the RGB load resistors. Also used as a shield for the RGB video output traces to the VGA display connector. Connects to RGB return pins 6, 7, and 8 of the VGA connector. Connect to main ground plane through a ferrite bead. Refer to the "Apollo ProMedia Design Guide" for more specific connection and PCB layout details. | | | | | |

Commonly Used Prefix / Suffix Letters in Signal Names:

I = Internal Logic A = North Bridge Clock Synthesizer M = Memory (SDRAM) Interface V1 = Video Clock Synthesizer PLL1 H = Host CPU Interface V2 = Video Clock Synthesizer PLL2 P = PCI Bus Interface D = Video Clocks Digital Data Path G = AGP Bus (internal in ProMedia) R = RAMDAC Digital Data Path GM = Graphics Memory Interface S = RAMDAC Current Source U (or USB) = USB (Universal Serial Bus) RGB = Analog Video Out Return TV = TV OutH (or HWM) = Hardware Monitoring

SUS = Suspend Power V = TV In / Video Capture

| 11/1/100 | Digital Power and Ground | | | | | | |
|-------------|--|------------|---|--|--|--|--|
| Signal Name | <u>Pin #</u> | <u>I/O</u> | Signal Description | | | | |
| VCC5 | U6 | P | Power for Display / Video Interfaces (5V ±5%). Power for CRT H/VSYNC, DFP interface, video interface, and TV interface. Used to provide adequate output voltage swing for driving external video devices. Also used to provide 5V input tolerance from those interfaces. | | | | |
| VCC3 | F7, F10, F12, F17, F20, G6, G21, H6, K21, L4, L12, L15, M11, M16, R11, R16, T4, T12, T15 , U21, W6, Y6, Y21, AA7, AA10, AA17, AA20 | | Power for On-Board Interfaces (2.5V to 3.3V ±5%). Power for hoc CPU / L2 Cache interface, PCI bus interface, and memory interface (except pins listed below under VSUS). | | | | |
| VSUS3 | V22, W22, AB22 | P | Suspend Power (3.3V ±5%). Power for memory interface signals SRASC#, SCASC#, SWEC#, SWEB#, RAS[5-0]#, CAS[7-0]#, and MECC[7-0] as well as SUSTAT# and SUSCLK. Connect to VCC3 if suspend functions are not implemented. | | | | |
| VSUS2 | AA22 | P | Suspend Power $(2.5V \pm 5\%)$. Connect to VCCI if suspend functions are not implemented. | | | | |
| VCCI | F9, F18, J6, J21, V6, V21, AA9, AA18 | P | Power for On-Chip Internal Logic (2.5V ±5%). | | | | |
| VCCD | W1 | P | Power for Video Clock Synthesizer Digital Logic (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see "Apollo ProMedia Design Guide"). | | | | |
| VCCR | DI DI | P | Power for RAMDAC Video Output Digital Logic (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see "Apollo ProMedia Design Guide"). | | | | |
| VTT | E11, F19 | P | CPU Interface Termination Voltage (1.5V ±10%). | | | | |
| GTLREF | E12, E21 | P | CPU Interface GTL+ Voltage Reference. 2/3 VTT ±2%. Derived from the termination voltage to the pullup resistors. Determines the noise margin for the host CPU interface signals. Internally connects to the GTL ⁺ sense amp on each GTL ⁺ input or I/O pin. | | | | |
| GND WWW.100 | A9, A18, A26, B2, C8, C14, C19, D4, D23, F6, F13-F14, F16, F21, H24, J26, L11, L13, L14, L16, M12-M15, M21, N3, N6, N11-N16, N21, P1, P6, P11-P16, P21, R12-R15, T11, T13, T14, T16, T21, V26, W24, AA6, AA13-AA15, AA21, AC4, AC23, AD8, AD13, AD19, AF1, AF9, AF18, AF26 | P | Ground. Connect to primary PCB ground plane. | | | | |
| NC | A2-A5, B3-B5, C3-C5, Y5, AA3-AA5, AB1-AB4, AC1 | N - | No Connect. | | | | |

REGISTERS

Register Overview

The following tables summarize the configuration and I/O registers of the ProMedia. These tables also document the power-on default value ("Default") and access type ("Acc") for each register. Access type definitions used are RW (Read/Write), RO (Read/Only), "—" for reserved / used (essentially the same as RO), and RWC (or just WC) (Read / Write 1's to Clear individual bits). Registers indicated as RW may have some read/only bits that always read back a fixed value (usually 0 if unused); registers designated as RWC or WC may have some read-only or read write bits (see individual register descriptions following these tables for details). All offset and default values are shown in hexadecimal unless otherwise indicated.

Register Summary Tables

Table 2. Register Summary

I/O Ports

| Port # | I/O Port | Default | Acc |
|--------|---------------------------|-----------|-----|
| 22 | PCI / AGP Arbiter Disable | 00 | RW |
| CFB-8 | Configuration Address | 0000 0000 | RW |
| CFF-C | Configuration Data | 0000 0000 | RW |

Device 0 Bus 0 Registers - Host Bridge

PCI Configuration Registers

| Offset | Configuration Header | Default | Acc |
|--------|--------------------------------------|-----------|---------------|
| 1-0 | Vendor ID | 1106 | RO |
| 3-2 | Device ID | 0601 | RO |
| 5-4 | Command | 0006 | RW |
| 7-6 | Status | 0290 | WC |
| 8 | Revision ID | nn | RO |
| 9 | Program Interface | 00 | RO |
| A | Sub Class Code | 00 | RO |
| В | Base Class Code | 06 | RO |
| C | -reserved- (cache line size) | 00 | _ |
| D | Latency Timer | 00 | \mathbf{RW} |
| Е | Header Type | 00 | RO |
| F | Built In Self Test (BIST) | 00 | RO |
| 13-10 | Graphics Aperture Base | 0000 0008 | RW |
| 14-27 | -reserved- (base address registers) | 00 | |
| 28-2B | -reserved- (unassigned) | 00 | |
| 2D-2C | Subsystem Vendor ID | 0000 | RW |
| 2F-2E | Subsystem ID | 0000 | RW |
| 33-30 | -reserved- (expan ROM base addr) | 00 | |
| | Capability Pointer | 0000 00A0 | RO |
| 34-3B | -reserved- (unassigned) | 00 | |
| 3C-3D | -reserved- (interrupt line & pin) | 00 | Û |
| 3E-3F | -reserved- (min gnt and max latency) | 00 | |

Device-Specific Configuration Registers

| Offset | CPU Interface Control | Default | Acc |
|--------|-------------------------|---------|-----|
| 50 | Request Phase Control | 00 | RW |
| 51 | Response Phase Control | 00 | RW |
| 52 | Dynamic Defer Timer | 10 | RW |
| 53 | Miscellaneous | 00 | RW |
| 55-54 | Non-Cacheable Region #1 | 0000 | RW |
| 57-56 | Non-Cacheable Region #2 | 0000 | RW |

| Offset | DRAM Control | Default | Acc |
|--------|--------------------------------|---------|-----|
| 59-58 | MA Map Type | 0000 | RW |
| 5A-5F | DRAM Row Ending Address: | | |
| 5A | Bank 0 Ending (HA[29:22]) | 01 | RW |
| 5B | Bank 1 Ending (HA[29:22]) | 01 | RW |

<u>3D Graphics Engine Registers</u>
These registers are addressed at offsets from the Graphics Engine Base Address (GEbase). All registers are 32-bit.

Miscellaneous I/O

One I/O port is defined in the ProMedia: Port 22.

| Port 22 | 2 – PCI /AGP Arbiter DisableRW |
|---------|---|
| 7-2 | Reserved always reads 0 |
| 1 | AGP Arbiter Disable |
| | 0 Respond to GREQ# signaldefault |
| | 1 Do not respond to GREQ# signal |
| 0 | PCI Arbiter Disable |
| | 0 Respond to all REQ# signalsdefault |
| | 1 Do not respond to any REQ# signals, including |
| | PREQ# |
| | |

This port can be enabled for read/write access by setting bit-7 of Device 0 Configuration Register 78.

Configuration Space I/O

All registers in the ProMedia (listed above) are addressed via the following configuration mechanism:

Mechanism #1

These ports respond only to double-word accesses. Byte or word accesses will be passed on unchanged.

| 31 | Configuration Space Enable |
|-------|--|
| | 0 Disabled default |
| | 1 Convert configuration data port writes to |
| | configuration cycles on the PCI bus |
| 30-24 | Reserved always reads 0 |
| 23-16 | PCI Bus Number |
| | Used to choose a specific PCI bus in the system |
| 15-11 | Device Number |
| | Used to choose a specific device in the system |
| | (devices 0 and 1 are defined) |
| 10-8 | Function Number |
| | Used to choose a specific function if the selected |
| | device supports multiple functions (only function 0 is |
| | defined). |
| 7-2 | Register Number (also called the "Offset") |
| | Used to select a specific DWORD in the |
| | A |
| | configuration space |

Port CFF-CFC - Configuration Data.....RW

Refer to PCI Bus Specification Version 2.2 for further details on operation of the above configuration registers.

Register Descriptions

Device 0 Bus 0 Header Registers - Host Bridge

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through CF8 / CFC with $\underline{\text{bus number}}$, $\underline{\text{function number}}$, and $\underline{\text{device number}}$ equal to $\underline{\text{zero}}$.

| device in | equal to zero. |
|---------------|--|
| Device | 0 Offset 1-0 - Vendor IDRO |
| 15-0 | ID Code (reads 1106h to identify VIA Technologies) |
| Device (| 0 Offset 3-2 - Device IDRO |
| 15-0 | ID Code (reads 0601h to identify the VT8601) |
| | |
| Device (| 0 Offset 5-4 - CommandRW |
| 15-10 | Reserved always reads 0 |
| 9 | Fast Back-to-Back Cycle EnableRO |
| | 0 Fast back-to-back transactions only allowed to |
| | the same agentdefault |
| | 1 Fast back-to-back transactions allowed to |
| | different agents |
| 8 | SERR# Enable RO |
| | 0 SERR# driver disableddefault |
| | 1 SERR# driver enabled |
| | (SERR# is used to report parity errors if bit-6 is set). |
| 7 | Address / Data SteppingRO |
| | 0 Device never does steppingdefault |
| | 1 Device always does stepping |
| 6 | Parity Error ResponseRW |
| | 0 Ignore parity errors & continuedefault |
| | 1 Take normal action on detected parity errors |
| 5 | VGA Palette SnoopRO |
| | 0 Treat palette accesses normallydefault |
| | 1 Don't respond to palette accesses on PCI bus |
| 4 | Memory Write and Invalidate CommandRO |
| | 0 Bus masters must use Mem Writedefault |
| | 1 Bus masters may generate Mem Write & Inval |
| 3 | Special Cycle MonitoringRO |
| | O Does not monitor special cyclesdefault |
| | 1 Monitors special cycles |
| 2 | Bus MasterRO |
| | 0 Never behaves as a bus master |
| | 1 Can behave as a bus masterdefault |
| 1 | Memory SpaceRO |
| | 0 Does not respond to memory space |
| | 1 Responds to memory spacedefault |
| 0 | I/O Space RO |
| | O Does not respond to I/O spacedefault |
| | 1 Responds to I/O space |
| | |

| Device | 0 Offset 7-6 - Status RWC |
|---------------|--|
| 15 | Detected Parity Error |
| | 0 No parity error detected default |
| | 1 Error detected in either address or data phase. |
| | This bit is set even if error response is disabled |
| | (command register bit-6)write one to clear |
| 14 | Signaled System Error (SERR# Asserted) |
| | always reads 0 |
| 13 | Signaled Master Abort |
| | O No abort receiveddefault |
| | 1 Transaction aborted by the master |
| | write one to clear |
| 12 | Received Target Abort |
| | 0 No abort receiveddefault |
| | 1 Transaction aborted by the target |
| | write 1 to clear |
| 11 | Signaled Target Abortalways reads 0 |
| Ρ | 0 Target Abort never signaled |
| 10-9 | DEVSEL# Timing |
| | 00 Fast 01 Mediumalways reads 01 |
| | |
| | 10 Slow |
| | 11 Reserved |
| 8 | Data Parity Error Detected 0 No data parity error detecteddefault |
| | |
| | 1 Error detected in data phase. Set only if error |
| | response enabled via command bit- $6 = 1$ and VT8601 was initiator of the operation in which |
| | the error occurredwrite one to clear |
| 7 | Fast Back-to-Back Capablealways reads 1 |
| 6 | Reserved |
| 5 | 66MHz Capable always reads 0 |
| 4 | Supports New Capability listalways reads 1 |
| 3-0 | Reserved |

Device 0 Bus 0 Host Bridge Registers

CPU Interface Control

| Device | 0 Offset 50 - Request Phase Control (00h)RW |
|--------|--|
| 7 | CPU Hardwired IOQ (In Order Queue) Size |
| | Default per strap on pin MA11 during reset. This |
| | register bit can be written to 0 to restrict the chip to |
| | one level of IOQ. |
| | 0 1-Level |
| | 1 4-Level default if no external strap resistor |
| 6 | Read-Around-Write |
| | 0 Disabledefault |
| | 1 Enable |
| 5 | Reserved always reads 0 |
| 4 | Defer Retry When HLOCK Active |
| | 0 Disabledefault |
| | 1 Enable |
| | Note: always set this bit to 1 |
| 3-2 | Reserved always reads 0 |
| 1 | Fast Speculative Read |
| | 0 Disabledefault |
| | 1 Enable |
| 0 | CPU / PCI Master Read DRAM Timing |
| | 0 Start DRAM read <u>after</u> snoop complete def |
| | 1 Start DRAM read <u>before</u> snoop complete |
| | |

| 7 | CPU Read DRAM 0WS for Back-to-Back Read |
|---|---|
| | Transactions |
| | 0 Disabledefault |
| | 1 Enable |
| | Setting this bit enables maximum read performance |
| | by allowing continuous 0-wait-state reads for |
| | pipelined line reads. If this bit is not set, there will be |
| | at least 1T idle time between read transactions. |
| 6 | CPU Write DRAM 0WS for Back-to-Back Write |
| | Transactions |
| | 0 Disable default |
| | 1 Enable |
| | Setting this bit enables maximum write performance |
| | by allowing continuous 0-wait-state writes for |
| | pipelined line writes ands sustained 3T single writes. |
| | If this bit is not set, there will be at least 1T idle time |
| | between write transactions. |
| 5 | DRAM Read Request Rate |
| | 0 3Tdefault |
| | 1 2T |
| 4 | Fast Response (HIT/HITM Sampled 1T Earlier) |
| | 0 Disabledefault |
| | 1 Enable |
| 3 | Non-Posted IOW |
| | 0 Disabledefault |
| | 1 Enable |
| 2 | CPU Read DRAM Prefetch Buffer Depth |
| | 0 1-level prefetch bufferdefault |
| | 1 4-level prefetch buffer |
| 1 | CPU-to-DRAM Post-Write Buffer Depth |
| | 0 1-level post-write bufferdefault |
| | 1 4-level post-write buffer |
| 0 | Concurrent PCI Master / Host Operation |
| | 0 Disable – the CPU bus will be occupied (BPRI |
| | asserted) during the entire PCI operationdef |
| | 1 Enable – the CPU bus is only requested before |
| | ADS# assertion |
| | |

| <u>Device</u> | 0 Offset 52 – Dynamic Defer Timer (10h)RW |
|---------------|--|
| 7 | GTL I/O Buffer Pullupdefault = MA13 Strap |
| | 0 Disable |
| | 1 Enable |
| | The default value of this bit is determined by a strap |
| | on the MA13 pin during reset. |
| 6 | RAW Write Retire After 2 Writes |
| | 0 Disabledefault |
| | 1 Enable |
| 5 | Reserved always reads 0 |
| 4-0 | Snoop Stall Count |
| | 00 Disable dynamic defer |

DRAM Control

These registers are normally set at system initialization time and not accessed after that during normal system operation. Some of these registers, however, may need to be programmed using specific sequences during power-up initialization to properly detect the type and size of installed memory (refer to the VIA Technologies VT8601 BIOS porting guide for details).

Table 3. System Memory Map

| | 10 | |
| | 11 | Allow SMI Axxxx-Bxxxx DRAM access |
| | | TI 10000 PUTTE 11 |

Note: The A0000-BFFFF address range is reserved for use by VGA controllers for system access to the VGA frame buffer. Since frame buffer accesses are normally directed to the system VGA controller (with its separate memory subsystem), system DRAM locations in the A0000-BFFFF range would normally be unused. Setting the above bits appropriately allows this block of system memory to be used by directing Axxxx-Bxxxx accesses to corresponding memory addresses in system DRAM instead of directing those accesses to the PCI bus for VGA frame buffer access.

| 3 | PCI | |
| | 0 | Disable default |
| | 1 | Enable (bit7=1 will override this option) |
| bit-7 | bit-3 | Operation |
| 0 | 0 | Every write goes into the write buffer and no |
| | | PCI burst operations occur. |
| 0 | 1 | If the write transaction is a burst transaction, |
| | | the information goes into the write buffer and |
| | | burst transfers are later performed on the PCI |
| | | bus. If the transaction is not a burst, PCI write |
| | | occurs immediately (after a write buffer flush). |
| 1 | X | Every write transaction goes to the write |
| | | buffer; burstable transactions will then burst |
| | | on the PCI bus and non-burstable won't. This |
| | | is the normal setting. |
| 2 | PCI I | Fast Back-to-Back Write |

GART / Graphics Aperture Control

The function of the Graphics Address Relocation Table (GART) is to translate virtual 32-bit addresses issued by an AGP device into 4K-page based physical addresses for system memory access. In this translation, the upper 20 bits (A31-A12) are remapped, while the lower 12 address bits (A11-A0) are used unchanged.

A one-level fully associative lookup scheme is used to implement the address translation. In this scheme, the upper 20 bits of the virtual address are used to point to an entry in a page table located in system memory. Each page table entry contains the upper 20 bits of a physical address (a "physical page" address). For simplicity, each page table entry is 4 bytes. The total size of the page table depends on the GART range (called the "aperture size") which is programmable in the VT8601.

This scheme is shown in the figure below.

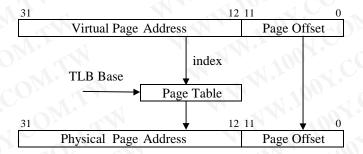

Figure 4. Graphics Aperture Address Translation

Since address translation using the above scheme requires an access to system memory, an on-chip cache (called a "Translation Lookaside Buffer" or TLB) is utilized to enhance performance. The TLB in the 82C501 contains 16 entries. Address "misses" in the TLB require an access of system memory to retrieve translation data. Entries in the TLB are replaced using an LRU (Least Recently Used) algorithm.

Addresses are translated only for accesses within the "Graphics Aperture" (GA). The Graphics Aperture can be any power of two in size from 1MB to 256MB (i.e., 1MB, 2MB, 4MB, 8MB, etc). The base of the Graphics Aperture can be anywhere in the system virtual address space on an address boundary determined by the aperture size (e.g., if the aperture size is 4MB, the base must be on a 4MB address boundary). The Graphics Aperture Base is defined in register offset 10 of device 0. The Graphics Aperture Size and TLB Table Base are defined in the following register group (offsets 84 and 88 respectively) along with various control bits.

| Device | 0 Offset 83-80 - GART/TLB ControlRW | Device (| 0 Offset 84 - Graphics Aperture SizeRW |

Device 0 Bus 1 Header Registers - Graphics Accelerator

The Apollo ProMedia 2D / 3D Graphics Accelerator is fully compliant with PCI bus interface protocol revision 2.2. The controller implements slave functions of PCI to accept cycles initiated by PCI masters targeted for its internal registers, RAMDACTM, frame buffer, and/or BIOS. It will accept only one data transaction for non-memory type transfers; however burst read/write transfers for frame buffer accesses are also implemented for performance enhancement. Bursting is disabled when accessing memory mapped I/O. Data parity will be generated for read cycles.

To support the PC AT architecture, palette snooping is supported. There are two different palette snooping modes: (1) snooping due to PCI retry, and (2) snooping due to master abort. Both modes are supported. The video BIOS will automatically determine the correct snooping mode in a PCI based system during power up. The ProMedia follows the PCI 2.2 specification running at 33 MHz or lower system clock frequencies. For packed pixel modes, if the first data TRDY is not generated within 16 clocks, a retry will be issued. During bursting, if successful data is not generated within 8 clocks, a retry will also be issued.

The table below lists the commands implemented by the ProMedia graphics controller PCI interface. Note that codes not listed (0000 interrupt acknowledge, 0001 special cycle, 0100, 0101, 1000, 1001 reserved, and 1101 dual address cycle) are not decoded and DEVSEL# is not generated. No action takes place inside the chip for these codes.

Table 6. Supported PCI Command Codes

| Command Code | Command |
|---------------------|--|
| 0010 | I/O Read |
| 0011 | I/O Write |
| 0110 | Memory Read |
| 0111 | Memory Write |
| 1010 | Configuration Read |
| 1011 | Configuration Write |
| 1100 | Memory Read Multiple (treated as simple memory read) |
| 1110 | Memory Read Line (treated as simple memory read) |
| 1111 | Memory Write and Invalid (treated as simple memory write) |

The PCI configuration space is fully implemented. Due to the second memory base register, all I/O registers can be memory mapped; which allows more than one graphics controller to be installed within a system by mapping memory and I/O to different locations.

All configuration registers are located in PCI configuration space and should be programmed using PCI configuration mechanism 1 through CF8 / CFC with <u>bus number</u> equal to <u>one</u> and <u>function number</u> and <u>device number</u> equal to <u>zero</u>.

There are three memory base registers. The first defines the memory base location for the graphics frame buffer. The second defines the memory base for the memory mapped I/O locations. The third defines the memory base for the second video aperture. With this second aperture, graphics data and video data can be sent to the ProMedia simultaneously.

The ProMedia supports the PCI Bus Master mode which can send captured video data directly to system memory for processing. The registers to control the PCI Bus Master are defined in following sections (they are all in PCI configuration space).

Interrupts

There are several interrupt sources and their corresponding controls in the ProMedia as shown in the following table:

Table 7. Interrupt Sources and Controls

| Source | Mask | Clear | Status |
|----------------------|---------|----------------------|---------|
| Capture ³ | CR9B[7] | CR9B[6] ¹ | CR9B[4] |
| Capture VSYNC | 2 | 41 | |
| Capture Even Field | 2 | 0.4. | |
| Capture Odd Field | 2 | 41. | |
| Capture Blank | 2 | 00 , | ~ () ja |
| GE^4 | 2122[7] | 2122[7] | 2120[4] |
| VGA ⁵ | CR11[5] | CR11[4] | 70 |

- 1) Write 0 to clear.
- 2) Selected by CR9E[7:6]
- 3) Video capture logic can generate an interrupt which is selected from one of four sources determined by CR9E.[7:6]. This interrupt is enabled by CR9B[7]. To clear this bit write 0 to CR9B[6]. Whether an interrupt is generated can be determined from CR9B[4].
 - 4) The GE interrupt is similar to the capture interrupt.
 - 5) The VGA interrupt is similar to the capture interrupt except that there is no status bit.

TOON COM LAN

Graphics Accelerator PCI Bus Master Registers

The ProMedia PCI Bus Master controller supports both read/write and scatter/gather. Software can take advantage of this feature to transfer data between system memory and the frame buffer. After software sets the proper registers and commands, the PCI master begins to transfer data automatically between system memory and the frame buffer. This allows the CPU to do other jobs at the same time, thus increasing performance.

Software should use the PCI Bus Master functionality to transfer big chunks of data such as video capture data for video conferencing applications or texture data for 3-D applications. For small chunks of data, direct CPU access to the Frame Buffer is the preferred method.

The software sequence used to control bus master operation is as follows: Software first sets registers such as the system memory starting address, page table starting address / height / width, and frame buffer starting address and line offset. Software finally sets the bus master control register where either bit 1 (for reads) or bit 2 (for writes) is set as the command bit. After the command bit is set, the hardware will begin to transfer data automatically based on the parameters specified. After the transfer is finished, the hardware will issue an interrupt. Software can then poll the status bit to get the transfer status. The hardware will clear the command bit after the transfer is finished. Software cannot issue new commands until the previous command is completed.

All Registers are memory mapped. The memory address base is defined in PCI configuration register "Memory Base 1" (offset 17h-14h).

Port 2204 – Graphics Bus Master StatusRO

- 31-3 Reserved always reads 0
- 2 Bus Master Interrupt Status
- 1 End of Transfer
 - 0 Still processingdefault
 - 1 End of Transfer (Idle)
- 0 Bus Master Error Status
 - 0 Normaldefault
 - 1 Error Detected

This error is usually detected because the total page table size is less than the size defined in the "Graphics Bus Master Height" register at index 2314h.

| 2 | Write Commanddefault =0 |
| | Writing this bit to 1 will trigger the hardware to begin |
| | a write operation. After finishing the operation, |
| | hardware will automatically clear this bit. |
| 1 | Read Command default =0 |
| | Writing this bit to 1 will trigger the hardware to begin |
| | a read operation. After finishing the operation, |
| | hardware will automatically clear this bit. |
| 0 | Scatter / Gather |
| | 0 Disable default |
| | 1 Enable |
| | |

Port 2310 - Graphics Bus Master System Start Addr ... RW

31-0 System Start Address

If scatter / gather is enabled, bits 31:12 point to the physical region translation table (the page starting address must be aligned on 4KB address boundaries) and bits 11:0 are the offset within a page.

Physical Region Descriptor Table

While system memory is allocated in a non-contiguous space, software needs to provide a physical region description table in system memory and pass the table's starting address to hardware.

The table size must less than or equal to 4K bytes and the table cannot cross the 4K boundary.

Figure 5. Physical Region Descriptor Table Format

| BYTE1 | BYTE0 |
|-------|-------|
| 111. | EOT |
| 1100 | EOT |
| | |
| | EOT |
| | BYTE1 |

EOT = End of Table

Each table entry is 4 bytes in length. Hardware assumes that the physical page is always 4K. Bits 31:2 indicate the physical page starting address. Bit 0 of the first byte indicates the end of the table. Bus Master operation terminates when the last descriptor has been retired.

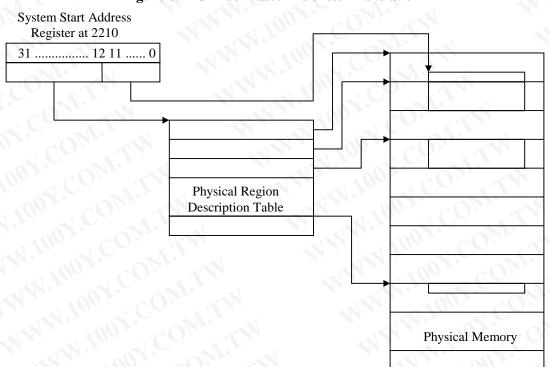

Figure 6. PCI Bus Master Address Translation

Graphics Accelerator AGP Registers

The default base I/O address for the AGP registers is 2300h.

The AGP control unit has 3 channels. These channels can work independently and in parallel. Each channel has its own capabilities:

- Channel 0: Execution mode texture access.
- Channel 1: Command List Operation. Executes command lists from AGP memory.
- Channel 2: Data Move. Moves data from AGP memory to frame buffer or to the Capture/MPEG2 FIFO. Also moves data from the frame buffer to AGP memory.

Graphics AGP Configuration Registers

| Port 2304 - Graph | nics AGP Capability | List | RW |
|-------------------|---------------------|------|----|
| 31-0 vv | | | |

Port 2334 – Graphics AGP Capability List Address.....RW 31-0 xx

Graphics AGP Operation Registers

| 31-19 | Reserved | always reads 0 |
|---------|----------------------------|--------------------------|
| 18-0 | Frame Buffer Command L | List Start Address |
| Port 23 | 44 – Graphics AGP FB Con | nmand List SizeRW |
| 31-19 | Reserved | always reads 0 |
| 18-3 | Frame Buffer Command L | List Size (in quadwords) |
| | Value programmed is the de | esired size minus one |
| 2.0 | Dagannad | al da O |

Port 2340 - Graphics AGP FB Command List Start RW

Command List Format

The command list is stored in AGP memory in groups. Each group has the following format:

| | Bit | Bit |
|----------|------------------|------------------|
| QuadWord | 63 48 32 | <u>31 16 0</u> |
| 0 | Data 0 | Header |
| 1 | Data 2 | Data 1 |
| 2 | Data 4 | Data 3 |
| n/2+1 | Pad/Data n-1 | Data n – 1/2 |

The header is a 32-bit word that contains information about this group, such as the amount of useful data in the group. A group is always padded to a quadword boundary. Padding DWORDs are discarded by the channel. The format of the header is as follows:

31 Consecutive Addressing

- O Disabled (all data in this group will be written to the register with the destination address specified in the "ADDR" field in bits 29-8)
- 1 Enabled (All data in this group will be written to registers ADDR, ADDR+4, ... ADDR+4 * (LEN-1) sequentially

30 Wait

- O Don't Wait (send data to the Graphics Engine as long as it can receive it)
- 1 Wait (until the GE is idle, then send data)
- 29-8 Register Address of the First Data (ADDR)
- 15-0 Number of DWORDs of Data in this Group (LEN)

Command List Operation

The ProMedia implements an internal block called the "Command List Control Unit" to process command lists. Command list operation is invisible to software. initialization of the Command List Control Unit, software can set registers as if there is no Command List Control Unit. If an engine is idle and there are no pending commands in the command buffer, data will be passed to the corresponding register directly. Otherwise, address and data will be stored into the command buffer to be processed later. When the engine is idle, the Command List Control Unit will fetch commands from the command buffer which is located in video memory and send it to the engine. There are two registers that determine the lower and upper bounds of the command buffer, the Command Buffer Start and Command Buffer End registers. The Command List Control Unit uses the command buffer in a round robin fashion, i.e., the address is wrapped around when it passes the end of the buffer.

Registers in the Setup Engine, Rasterization Engine, Pixel Engine, Memory Interface, and data from the host CPU and the drawing environment can be buffered by the Command List Control Unit. Command List Control registers and VGA extension registers cannot be buffered. Every entry in the command buffer is 64-bit with the lower 32 bits for the register address and the higher 32 bits for register data. In order to optimize memory bandwidth usage, the Command List Control Unit maintains one read and one write FIFO in its interface to memory in order to burst information from the read/write command list.

End address of the command buffer in bytes This address should be (quadword aligned). programmed to one more than the address of the last byte of the command buffer.

VGA Standard Registers - Introduction

The standard VGA register set consists of five sets of indexed registers plus several individually addressed registers. All VGA registers are addressed at specific I/O port addresses defined by the VGA legacy standard.

The non-indexed registers (also called the "Status / Enable" registers) are:

Input Status Register 0 Read at 3C2

Input Status Register 1 Read at 3BA or 3DA
Miscellaneous Register Read at 3CC, Write at 3C2
Video Subsystem Enable Read/Write at 3C3
Display Adapter Enable Read/Write at 46E8

The indexed register sets each control different functional blocks inside the hardware VGA logic. These register sets are:

Attribute Controller 21 registers (0-14h) at 3C0/1
Sequencer 5 registers (0-4h) at 3C4/5
Graphics Controller 9 registers (0-8h) at 3CE/F
CRT Controller 25 registers (0-18h) at 3x4/5
RAMDAC 256 24-bit registers at 3C7-3C9

Indexed registers typically require two sequential port addresses, the first of which is the index and the second of which is the data. In other words, the index is written to the first port address and then the data corresponding to that indexed register is read from or written to the second port address. The exceptions to this are the Attribute Controller and the RAMDAC. For the Attribute Controller, the index is written at 3C0 as expected. Data reads (but not writes) can be performed from port 3C1 in the standard way. However, generally most data read and all data write operations use the same 3C0 port as used for the index. Data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed (reads from 3BA or 3DA reset the flag to point at the index The other exception to the 2-port index/data register). structure is the RAMDAC which uses three port addresses. In this case, there are two locations provided for the index, 3C7 and 3C8, with the data at 3C9. There is actually only one index register, but automatic pre / post incrementation is performed differently depending on whether the index is written at the "Read" address (3C7) or the "Write" address (3C8). The current index value may be read at 3C8. Refer to the RAMDAC register group for further explanation of the operation of the index registes and sequential access to the three data bytes of each indexed data location.

The number of registers listed above for each indexed register group is the number of registers defined by the VGA standard. The operation of these "base" registers will always be exactly the same from one vendor's implementation of the VGA to another. Typically, however, there are additional non-standard / extended functions implemented in higher numbered index values. That is the case for this chip as well,

where extended functions are provided in all indexed register groups except the Attribute Controller (due to the unusual nature of Attribute Controller indexing using a single I/O port which makes access to this register group more cumbersome). This document will detail the functions of all the standard VGA registers first. All extended functions will then be separately documented in following sections.

Regarding notation used in this document, indexed registers (including extended registers) may be referenced using a 2-letter mnemonic from the following table followed by the index number:

Attribute Controller AR
Graphics Controller GR
CRT Controller CR
Sequencer SR

For example, index register 26h of the 3CE / 3CFh indexed register group could also be referred to as GR26. Bit-7 if this register, using this notation, would be GR26[7].

Register groups, for the most part, are included in this document in order by I/O port address. Some registers are included out of order with other registers in the same functional block. Refer to the table of contents and the register summary tables at the beginning of the register section of this document for further information and help in finding descriptive information for a specific register.

For standard VGA registers, primarily only the bit definitions are provided here. Since the operation of these bits was standardized long ago, full explanation of the operation of these bits is not provided in this document. Detailed explanation of these bits is provided by many fine indiustry publications (check your local computer book store or the internet for further information).

VGA Registers

Attribute Controller Registers (AR)

For this indexed register group, the index is accessed at 3C0 as expected. However, although data operations can be performed using port 3C1 in the standard way, data is generally accessed at 3C0 as well. In other words, data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed. The state of the internal flag may be read back in the extended registers (see CR24). To set the internal flag to select the index (i.e., to set the flag so that the next access to port 3C0h points to the index register), read port 3BAh or 3DAh (depending on the state of the color / mono bit in the Miscellaneous Output Register at 3C2[0]). Attribute Controller register data may be read at 3C1 (the internal flag is not toggled) but must be written at 3C0.

GR26 - DPMS ControlRW **RAMDAC Internal Power Control** 00 Normaldefault DAC off (used in LCD only mode) Standby (DAC off, LUT in low power mode, I/O allowed to LUT). May be used in LUT bypass mode. Suspend (DAC off, LUT access disallowed but LUT contents are preserved) Reserved always reads 0 **DPMS Control** 0 Software Control Mode: DPMS controlled by GR23[1-0] in simultaneous display and CRTonly modes (may be used to decouple the power modes of the CRT and LCD during simultaneous display)default Hardware Control Mode: DPMS controlled by internal power states. Reserved always reads 0

DPMS Control Modes

DPMS Software Control Mode

In simultaneous display mode, the software control mode can be used to control DPMS low power states independent of the chip power states. In CRT display mode, software mode gives total DPMS control to software. Pseudo-standby may be controlled by bits 7 and 6, as well as BLANK# timing.

DPMS Hardware Control Mode

Table 9. DPMS Sequence - Hardware Timer Mode

| Power Level | DPMS Mode |
|------------------------------|------------------|
| High - Activity detected | On |
| Moderate - 16 min inactivity | Standby |
| Low - 32 min inactivity | Suspend |
| Lowest - 64 min inactivity | Off |

DPMS hardware timer mode is defined as CRT only mode with the DPMS control mode bit set to hardware (bit 3 = 1). Activity detection is set by register GR21[2:0]. Status is indicated in bits 1 and 0. The timer may be controlled by software from GR20[7].

Table 10. DPMS Sequence - Hardware Mode in Simultaneous Display Mode

| Power Level | DPMS Mode |
|-------------------------|-----------|
| High - Chip on state | On |
| Moderate - Chip standby | Off |
| Low - Chip suspend | Off |
| Lowest - Chip off state | Off |
| | |

In simultaneous display mode with hardware DPMS set, DPMS states are sequenced by the timer, pin, and register bits that control the chip power states.

Hardware Cursor Registers

The ProMedia supports a Windows® compatible hardware cursor. The hardware cursor operates only in extended planar and packed pixel modes. The cursor size can be selected between 32x32 and 64x64. Two 2-bits-per-pixel images define the cursor shape. The table below shows how these two bits operate on each pixel. The hardware cursor pattern is stored in off-screen memory.

Table 11. Hardware Cursor Pixel Operation

Video Display and Capture Engine Registers

The ProMedia integrates video display and capture engines, which support YUV 4:2:2, YUV12 (planar) or YUV 4:1:1 data formats to accelerate software playback and video capture functions. Video images can be captured through a special video capture port or the PCI bus. Dual apertures on the PCI bus enable graphics and video data to be transported simultaneously without any software involvement. The video image can be smoothed through a programmable multi-tap filter to reduce the jig-jag effect after minification. The video data can be minified to save bus bandwidth or memory space and written into offscreen memory. The video display engine fetches YUV 4:2:2 or planar video data from offscreen memory and can be scaled up with linear interpolation in both X and Y directions. The video data stream is converted into a True Color RGB24 data stream and multiplexed with the graphics data. Two live video windows can be supported. The graphics data and video data can be handled smoothly in different color depths with color key support. A hardware anti-tear mechanism prevents the tearing effect due to frame buffer update and eases the burden of software to flip the page. Since the hardware synchronizes the capture or PCI video address pointer with the playback VSYNC, the built-in algorithm ensures the playback frame buffer is free from the frame update. For the parameters defined here, refer to the following figures.

Note that W1' is defined for the anti-tearing function. W1 is the first live video storage area and W2 is the second live video storage area. W1 could be in either packed pixel or planar format, while W2 can only be packed pixel mode. If W1 is in packed pixel mode, then W1-U and W1-V are not

used. If W1 is in planar mode, then W1-Y is the first live video Y-component storage area, and W1-U (V) is the first live video U (V) -component storage area. In the following register definitions, a register with W1 (W2) indicates that this parameter is applicable to the first (second) live video window only.

VGA Extended Registers - CRTC Shadow

Read/Write of Shadow registers is controlled by extended register GR30[6] (port 3CE/3CF index 30h). If GR30[6]=1, read/write operations to CRTC indices 0, 3-7, 10-11, and 16 are performed to the shadow registers instead of to the normal registers. Bit definitions for these registers are identical to the standard CRTC register set.

3D Graphics Engine Registers

This section describes how to program the ProMedia graphics engine for different operations. When the Setup Engine is to be used, the following steps should be taken to perform the drawing functions:

- Software sets up the drawing environment.
- Software issues a drawing command.
- Software continuously sends triangles to Setup engine.
- Software sends a triangle with last flag set or a null triangle to Setup engine to signal end of operation.

Operational Concept

From a programmer's point of view, operations that can be applied to the ProMedia fall into the following categories:

- Reset: This operation resets the GE to default status.
- Status: This operation returns the GE status.
- Drawing Environment: The operations set environment for drawing.
- Frame Buffer Control: The operations set control for the frame buffer.
- Drawing: Draw an object.
- Geometry Primitives: Describe a geometry primitive.

Drawing Environment defines a set of conditions that decide the operations to be applied to each pixel. Drawing Environment operations are straight-forward. There is a group of registers that defines the drawing environment. By directly setting these registers, a program can control the drawing environment.

Frame Buffer Control decides how to access the frame buffer. Like the Drawing Environment, there is a group of registers that define the frame buffer access. By directly setting these registers, a program can control frame buffer access.

Drawing

Bitblt - Frame Buffer to Frame Buffer

Blt operation may involve a pattern. If it does, and the pattern is stored in the frame buffer, the pattern parameters (P1, P2, P3) must also be set. The following registers must be set to provide the source and destination rectangles of blt: Ps1, Pd1, Ps2, and Pd2. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a blt command to Command Register.

Bitblt - CPU to Frame Buffer

The operation for blting from the CPU is similar to the blting from the frame buffer except that Ps1 and Ps2 are not needed and the data from the CPU must immediately follow the setting of the Command Register.

For all commands that require data from the CPU, the command and data are considered atomic; i.e., the data should follow the command immediately and no other command or parameter can be placed in between. The data can be written to Data Register III and IV. Alternatively, it can be written to a memory-mapped space designated by ProMedia apertures. The same rule applies to drawing text from the CPU to the frame buffer.

Text

Text glyph can be from the CPU or the frame buffer. When the glyph is from the CPU, the registers to be set are Pd1 and Pd2 for text location. When the glyph is stored in the frame buffer, the registers to be set are Ps1, Ps2, Pd1, and Pd2 to provide both the glyph and text locations. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a text command to Command Register.

The major difference between text and Blt is that a text source data is 8-bit aligned while the bitblt is 64-bit aligned. That is, for text, each new line starts at the byte boundary, while for a bitblt, at the 64-bit boundary.

A Note on CPU as the Source of Operation

Any operation that uses the CPU as the source of operation (such as the Blt shown in section x) requires the host CPU to feed data into data registers III and IV (BA+56 and 60). Since the ProMedia is using the 64-bit internal data path, any data (32-bit) from the CPU will be packed into 64-bit before use. Therefore, there are two registers for the CPU to write. These two registers are arranged as shown in the following diagram.

Writing to Data Register IV triggers data in both registers to be sent to the engine for processing. However, the hardware may expose the two registers as a mapped space to save software from toggling between the two registers.

Geometry Primitive

To draw a geometry primitive, the host must issue a drawing command by writing to the Command Register first and then set up the geometry as described in later in this document.

Geometry Primitives

The ProMedia supports the following geometry primitives: line, and polygon. Each geometry primitive can be further modified for 3D, shading, and texture mapping. A different mechanism, called sequential loading, performs the geometry primitive set up operation.

Loading Mechanism

There are two ways to set up a geometry primitive, random loading and sequential loading. Like the random access, the order is not important in random loading, but the address is. Writing to a certain address in the register space causes a certain pre-determined action. On the other hand, like sequential access, the order decides the data semantics in sequential loading. The ProMedia uses sequential loading in the Rasterization Engine and the Setup Engine.

In the ProMedia, parameters don't have to be the fixed addresses. ProMedia parameters are treated as a data stream and interpreted based on the type of primitive. Parameters must be set in a stream as follows:

P1 is the number of bytes for parameter 1, P2-P1 for parameter 2, etc.

For the Rasterization Engine, there are 9 kinds of parameters: Bresenham Edge, DDA Edge, Z, Texture, Perspective, Color, Specular/fog Start, Specular, and Fog. Parameters must appear in the following order:

Edge(Major), Texture, Perspective, Color, Specular/fog Start, Specular, Fog, Z, Edge(Minor)

There are two kinds of edges and only one kind can appear in a parameter stream. Bresenham Edge can only appear in 2D primitives (without values for iterators).

For the Setup Engine, there is only one kind of parameter: vertex. However, each primitive could have one or three vertices. The size of each vertex is variable depending on triangle attribute.

Only polygon and line primitives can use this sequential loading feature. In the following sections, each primitive is addressed in detail.

Polygon

General polygons can only be drawn by directly using the Rasterization Engine. In the ProMedia, all polygons must be Y-monolithic, meaning, when walking from the vertex with minimal Y to the vertex with maximum Y, the Y coordinates of the vertices are monolithically increased. A polygon is drawn by drawing a series of segments:

| Sequence | Content |
|----------|---|
| 0 | Drawing Command (Polygon) |
| 1 | Full Polygon Segment |
| 2 | Polygon Segment (Full or Partial) |
| 3 | Polygon Segment (Full or Partial) |
| | 100 , COp. 4 |
| n | Polygon Segment (Full or Partial) or a Null Primitive |

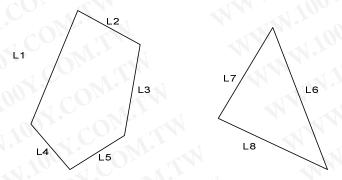

A partial segment consists of only one primitive type and one minor edge parameter. A full segment consists of one primitive type, edge parameter(s), and interpolation parameters (Z, color, texture, etc.). The rule is whenever a new major edge is in the segment a full segment must be used, otherwise a partial segment has to be used.

Most bit fields in primitive type define the data to be loaded to Rasterization Engine. If the "Re-load" bit is set, they also define the data set to be passed to Pixel Engine. The primitive type of the first and only the first segment must have the "Re-load" bit set to signal Rasterization Engine the data set to be passed to Pixel Engine. The primitive type of the last and only the last segment must have the "Last" bit set to signal the end of the sequence. The last of the primitive can be a Null primitive (others must be polygon). Null primitive has no parameter.

This mechanism can be used to draw a single polygon, as well as multiple polygons with the same attributes (e.g. 3D texture mapped). All that is required is that somewhere in the sequence we pass a full segment with starting edges of a new polygon.

The following example shows how to draw two shaded polygons.

| Sequence | Content |
|----------|--|
| 0 | Drawing Command |
| 1 | Full Segment including |
| | Primitive Type: Re-loading, Major & minor edge, color |
| | Major edge L1 |
| | Color Parameter for L1 |
| | Minor edge L2 |
| 2 | Partial Segment including |
| | Primitive Type: minor edge |
| | Minor Edge L3 |
| 3 | Full Segment including |
| | Primitive Type: Major edge, color |
| | Major Edge L4 |
| 1 | Color for L4 |
| 4 | Partial Segment including |
| . 1 | Primitive Type: Minor edge |
| | Minor Edge L5 |
| 5 | Full Segment including: |
| | Primitive Type: Major & minor edge, color, negative scan |
| | direction |
| | Major edge L6 |
| | Color Parameter for L6 |
| 7. | Minor edge L7 |
| 6 | Partial Segment including: |
| | Primitive Type: Minor edge, "Last" |
| 102 | Minor Edge L8 |

The following sections are about complete segments (a full segment with both major and minor edges) with different attributes. A normal full segment may not have the minor edge parameter. A partial segment has no other parameters except the minor edge.

| 6 | Color Parameter |
| 7 | Alpha Parameter (optional) |

Triangle

Triangles can be drawn using the Polygon Mechanism described above. Additionally, triangles can also be drawn by using the Setup Engine if they meet certain criteria. Triangles and polygons can also be freely mixed in a drawing sequence. The ProMedia supports stand-alone triangles as well as a triangle list in a sequence as follows:

| Sequence | Content |
|----------|---------------------------|
| 0 | Drawing Command (Polygon) |
| 1 | Triangle primitive |
| 2 | Triangle primitive |
| 3 | Triangle primitive |
| | |
| 1 | Triangle primitive |

Each primitive consists of a triangle attribute and one or three vertices. The order of the data in each primitive is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertices 1 and 2 are to be loaded depends on the Triangle Attribute. Writing to BA+192 triggers a loading sequence in the Setup Engine. The order of the data in a vertex is: Z, RGBA, UV, W, XY. Not every one has to appear in every vertex. Whether a particular item is present in a vertex is decided by the Triangle Attribute. For example, the Data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, U0V0, X0Y0.

Due to the limited precision of the setup engine, only triangles smaller than a certain size will be passed. Software will only pass triangles smaller than 64x128 or 128x64 to the hardware. Also, delta values of RGBAUVZ across a triangle will be less than 128. There is no limitation on the delta of W since it is impossible to exceed 1.

Line

Parameters for line primitives are very similar to their polygon counter-parts. The differences are as follows:

There are only major edge parameters.

All the dXm values (dRm, dUm, etc.) are ignored.

The following example shows these differences for a texture mapped primitive:

| Sequence | Polygon Content | Line Content |
|----------|-------------------|-------------------|
| 0 | Drawing Command | Drawing Command |
| 1 | Primitive Type | Primitive Type |
| 2 | Major Edge | Major Edge |
| 3 | Texture Parameter | Texture Parameter |
| 4 | Minor Edge | |

Using the same mechanism for multiple polygons, multiple lines can also be drawn by issuing one drawing command.

Synchronization

Reset and status operations can be performed in any order and at any time including in the middle of another operation. However, be aware of the consequence (reset) and what to expect (status).

Generally, Drawing Environment and Frame Buffer Control operations should be performed before the drawing operation to take effect.

The primitive operation is considered atomic; i.e., no other operation (except for status and reset) can be performed inside a Geometry Primitive operation.

Functional Blocks

The ProMedia hardware is divided into 6 major functional blocks. They are:

- Bus Interface (BI)
- VGA core (VGA)
- Setup Engine (SE)
- Rasterization Engine (RE)
- Pixel Engine (PE)
- Memory Interface (MI)

Each functional block conceptually works independently of other blocks. The term "Graphics Engine (GE)" indicates the combination of the Setup Engine, the Rasterization Engine, and the Pixel Engine.

Bus Interface

The bus interface block connects the AGP bus on one side and the GE and VGA on the other side.

Span Engine

PS1, PS2, PD1, and PD2 are used in blt and text operations to define source and destination rectangles.

| GEbase | + 0 - Parameter Source 1RW | | |

There are two input FIFOs to buffer data and commands from the host, the Command FIFO (8 levels deep) and the Bresenham FIFO (2 levels deep). Drawing commands, Drawing Environment, and Frame Buffer Control are routed through the Command FIFO. Primitive Type and Geometry Primitives are routed through the Bresenham FIFO. Commands in the Command FIFO don't take effect until a prior command is executed or the task in progress is finished. Parameters in the Bresenham FIFO don't take effect until a prior parameter is phased out (reaches the end of an edge).

GEbase + 2C - Graphics Engine Wait MaskRW Wait Mask

When writing to this register, hardware will monitor the value of M (Wait Mask & Status). If M is not 0, the Graphics Engine (including the RE, SE, PE, and MI) will not accept new registers from the host CPU or AGP bus. This register is cleared by the hardware when M = 0. Only bits 31-28, 26, 23, and 21-20 are effective (all other bits are ignored).

Graphics Engine Organization

The ProMedia Graphics Engine consists of the following units: Setup Engine, Rasterization Engine, and Pixel Engine. These units are organized as follows:

The interfaces among the components are:

- AGP to Pixel Engine: Set drawing environment registers.
- AGP to Rasterization Engine: Set primitives: edge walking, slopes.
- AGP or Setup Engine: Set vertices, culling info.
- Setup Engine to Rasterization Engine: Set primitives: edge walking, slopes.
- Rasterization Engine to Pixel Engine: Pixel Data, addresses and coordinates.
- Pixel Engine to Memory Interface: Addresses and coordinates, pixel data.

Each unit performs the following functions:

- Setup Engine: Back face culling, slope calculation.
- Rasterization Engine: Edge walking, color interpolation, Z, texture coordinates, perform perspective correction.
- Pixel Engine: Generate addresses and coordinate for all memory accesses: read/write Z, read texture, read source/destination, write destination (draw buffer), 2-D functions, bi/tri-linear interpolation, blending and modulation, ROP, Z test, alpha test, transparency, etc.

When the Setup Engine is to be used, the following steps should be taken to perform drawing functions:

- S/W sets up the drawing environment.
- S/W issues a drawing command.
- S/W continuously sends triangles to the Setup Engine (or primitives to the Rasterization Engine).
- S/W sends a triangle with last flag set or a null triangle to the Setup Engine to signal the end of the operation (or its equivalent to the Rasterization Engine).

Triangles sent to the Setup Engine can be interleaved with primitives sent to the Rasterization Engine in step 3 above.

The Setup Engine uses the same sequential loading mechanism as in the Rasterization Engine. The order of loading is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertex 1 and 2 are to be loaded depends on the Primitive Type. Writing to BA+4Ch triggers a loading sequence to the Setup Engine. The order of data in a vertex is: RGBA, SrgbF, W, UV, Z, XY. Not every one will appear in every vertex. Whether a particular item will be present in a vertex is decided by the Triangle Attribute. For example, the data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, U0V0, X0Y0.

GEbase + 2C - Setup Engine Status.....RO

31-0 Overflow Status

This register records setup engine overflow status. For every triangle, the entire register is shifted left one bit with bit-0 then set to reflect whether the triangle has slope overflow. This register is useful for debugging purposes. This register resides in the VGA address space and is not decoded by the setup engine.

Setup Engine Registers

| 1 | Auto Direction for Scan Line Ends (RE Only) |
| | 0 Disabledefault |
| | 1 Enable. Bits 31-2 must be 0. Scan order is |
| | passed to the Pixel Engine based on the |
| | comparison result of two end points instead of |
| | the bit in the Primitive Type register. Software |
| | should only use this bit for 2D polygons with |
| | Bresenham edge walking. |
| 0 | Bresenham Edge Walking (RE Only) |

Z Normalization (Setup Engine Only)

This register is decoded by the Setup Engine and passed to the Rasterization Engine by the Setup Engine. This register and its equivalent part in the Rasterization Engine are "partially" pipelined in the sense that there are only two levels of pipe for this register in both engines while there are many levels for other data. The two levels are the decoding level and the execution level. Both the Rasterization Engine and the Setup Engine use this register to decide what kind of operation to perform and what kind of data stream to expect. It must be set before any parameter can be loaded.

edges

Use DDA to walk through edges defaultUse Bresenham algorithm to walk through

GEbase + 3C –Setup Engine Primitive Type WO

Writing to this register signals the Graphics Engine to begin sequential loading. The engine will interpret the contents of this register and the Primitive Attribute register to decide the amount and types of parameters to expect. Like vertices, there is a FIFO for Triangle Attributes. The queue has three entries. Writing to this register adds it to the queue. The Setup Engine starts working whenever a triangle attribute is received and stops after it is finished processing a triangle with L=1.

31-30 Loading Target

- 00 Rasterization Engine. Send bits 19-0 to the RE. Sequential loading data will also be sent to the RE.....default
- 01 Setup Engine. Send bits 29-0 to the SE. Sequential loading data will also be sent to the SE. Internally, a flag is set to prevent the SE from decoding the data and sending it to the RE. The SE will clear this flag when it is idle.

- **24** (V2, V0) Edge Anti-Aliasing Flag default = 0
- 23 (V1, V2) Edge Anti-Aliasing Flag default = 0
- 22 (V1, V1) Edge Anti-Aliasing Flag default = 0

21 Full Vertices Information

- O Partial Vertices Information. Two of the vertices are from the previous triangle. Only one vertex is to be loaded from the vertex queue to the working registers.....default
- 1 All vertices are new. All three working registers are to be loaded from the vertex queue.

20-19 Working Vertex Index

Index of the working vertex that is to be replaced. This field is always 0 if F = 1.

18-3 Reserved always reads 0

2 Debug Control

- 0 Discard triangle on overflow......default
- 1 Draw triangle on overflow

1-0 Flat Color Vertex Index

Vertex index for flat color (Index of vertex whose color is passed to the RE as the starting color)

Vertex Registers

Inside the setup engine, one set of registers is provided to store the three vertices is is currently working on and an additional set is provided to store three pending vertices. Note that it doesn't always require 3 vertices to define a triangle (depending on the Triangle Attribute Register, it may be either 1 or 3 vertices).

Vertex information includes coordinate, texture, color, and depth. Some may be absent in a data stream. If any appear in a vertex, they must be present in the following order: Color, Specular Color, W, U, V, Z, X, Y. The formats are shown below:

Vertex Register 1 - Color Value

31-24 Alpha Value

23-16 Red Value

15-8 Green Value

7-0 Blue Value

Vertex Register 2 - Specular Color Value

31-24 Fog Value

23-16 Specular Red Value

15-8 Specular Green Value

7-0 Specular Blue Value

Vertex Register 3 - W Value

31-0 Texture W Coordinate. 32-bit floating # in (0, 1.0)

Vertex Register 4 - U Value

31-0 Texture U Coordinate. 32-bit floating number

Vertex Register 5 - V Value

31-0 Texture V Coordinate. 32-bit floating number

Vertex Register 6 - Z Value

31-0 Z Coordinate. 32-bit floating number

Vertex Register 7 - X Value

31-0 X Coordinate. 32-bit floating number

Vertex Register 8 - Y Value

31-0 Y Coordinate. 32-bit floating number

Floating Point Number Format

All floating point numbers are converted by on-chip hardware into internal fixed point integer format. All floating point numbers are specified in IEEE 32-bit floating point number format (shown below):

31 Sign

30-23 Exponent (excess-127 format)

22-0 Mantissa (fractional part of a number in "1.nn" format where the integer part is always 1)

Rasterization Engine Registers

The major responsibilities of the Rasterization Engine are:

- Receive data from host: Set registers, sequential loading of parameters.
- Edge walking: Generate end points of polygon edges or pixels on a line.
- Interpolation: Calculate values such as texture coordinates on a polygon / line.
- Perspective correction: Perform perspective correction.

In the ProMedia, the Rasterization Engine performs color (including alpha) interpolation, texture coordinate (perspective corrected) generation, Z coordinate interpolation, and texture gradient (perspective corrected) calculations.

Host access to the Rasterization Engine is by sequential writes to minimize AGP bandwidth requirements. This is not needed for the Setup Engine to access the Rasterization Engine. In addition, if sequential parameters were used to interface between the Setup Engine and the Rasterization Engine, it would incur extra cost for the Setup Engine to pack data and would also reduce performance. Therefore, the Setup Engine accesses working registers in the Rasterization Engine directly. To synchronize operation, hardware must wait until the Setup Engine becomes idle to accept data from the host to the Rasterization Engine.

Both Rasterization and Setup Engines share one interface to the AGP Write Buffer. The first reason is that both Rasterization Engine and Setup Engine use stream decoding to receive data from the host. Once they are inside a stream, they must act quickly to grab data to prevent other components from taking the data. Having two stream decoders in the graphics engine is a potential source for problems. The second reason is that both the Rasterization Engine and Setup Engine handle the same types of data. Coupling them tightly makes the design easier and reduces problems that arise from synchronization. The third reason is for better synchronization between the two engines.

The engine interfaces to the host through both random access registers and sequential loading. There are two random access registers: Primitive Attribute and Primitive Type. The Primitive Attribute register consists of most parameter information from the Rasterization Engine's Primitive Type and the Setup Engine's Triangle Attribute register.

The address space that can be used by sequential loading parameters is from Base Address + 40h to Base Address + FFh. Software should not use addresses outside this space for parameters. **Sequential loading must use the address in this space starting at 0x40H in ascending order.** For example, the first address must be 40h, the next must be 44h, etc. In order to give time to notify the other component to stop decoding, **address 40h is exclusively reserved for sequential loading.**

| J Lbase | <u> + 30 – RE Primitive AttributeRW</u> |

20-16 Reserved always reads 0

End coordinate of the primitive (inclusive). 12.4 signed integer.

Bresenham Edge Parameters

Bresenham Edge parameters describe an edge of a primitive or a line.

DoubleWord 0 - Start Coordinates

31-16 Start YS1

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

15-0 Start XS1

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

DoubleWord 1 - Drawing Direction / Bresenham Constant

31 YS Drawing Direction

- 0 Positive
- 1 Negative

30 XS Drawing Direction

- 0 Positive
- 1 Negative

29 Swap

- 0 Normal (X / Y not swapped)
- 1 X/Y swapped

28-16 Bresenham (or Modified) Constant

- 15-13 Reserved ignored
- 12-0 Bresenham (or Modified) Constant

DoubleWord 2 - Error Term / Strip Length

- 31-29 Reserved must be written as zero
- 28-16 Initial Error Term
- 15-12 Reserved must be written as zero
- 11-0 Strip Length

Strip length of modified Bresenham line.

DDA Edge Parameters

DDA Edge parameters describe an edge of a primitive or a line

DoubleWord 0 - Start Coordinates

31-16 Start YS1

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

15-0 Start XS1

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

DoubleWord 1 – Drawing Direction / Edge Slope

31 YS Drawing Direction

- 0 Positive
- 1 Negative

30 XS Drawing Direction

- 0 Positive
- 1 Negative

29 Swap

- 0 Normal (X / Y not swapped)
- X / Y swapped

28-26 Reserved ignored

25-0 Edge Slope

12.14 signed number

When a DDA edge is used as a polygon boundary, the fractional bits should round up to the next integer. Interpolation values should be adjusted accordingly. DDA edge walking shares the same logic as Bresenham edge walking by using an error advance method. In DDA walking, fractional bits should be rounded up to the next integer. Rounding up is performed by changing drawing convention according to whether the fractional parts are 0 as follows:

- Left fractional is 0: Left inclusive.
- Left fractional is not 0: Left exclusive.
- Right fractional is 0: Right exclusive.
- Right fractional is not 0: Right inclusive.

Because the error advance method is used for DDA walking, the fractional part is always one step ahead of the coordinate. For the starting point of a line, the fractional part is assumed to be 0.

Color Parameters

Color parameters are used for Gouraud shading. They consist of starting values, incremental along the X and Y axis. In flat color mode, this parameter only has the starting value.

DoubleWord 0 – Initial Values

31-24 Initial Alpha Value

Initial Alpha value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

23-16 Initial Red Value

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

15-8 Initial Green Value

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

7-0 Initial Blue Value

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

DoubleWord 1 – X-Axis Blue Gradient

31-0 X-Axis Blue Gradient

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 2 - Y-Axis Blue Gradient

31-0 Y-Axis Blue Gradient

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 3 - X-Axis Green Gradient

31-0 X-Axis Green Gradient

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 4 – Y-Axis Green Gradient

31-0 Y-Axis Green Gradient

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 5 - X-Axis Red Gradient

31-0 X-Axis Red Gradient

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 6 - Y-Axis Red Gradient

31-0 Y-Axis Red Gradient

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 7 - X-Axis Alpha Gradient

31-0 X-Axis Alpha Gradient

Gradient of Alpha along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 8 – Y-Axis Alpha Gradient

31-0 Y-Axis Alpha Gradient

Gradient of Alpha along the Y axis over the primitive surface. Signed 20.12 number.

Z Value Parameters

To the Rasterization Engine, the Z value is always a 25.8 signed integer internally regardless of Z buffer depth. It always passes a 24-bit unsigned integer to the Pixel Engine. It is the Pixel Engine's responsibility to scale Z to the depth of the Z buffer. Z parameters are used to calculate depth information. Z values consist of starting values, incremental along the X and Y axis.

DoubleWord 0 – Initial Z Value

31-0 Initial Z Value

Initial Z value on main edge (left edge of trapezoid or long edge of triangle). Signed 25.7 integer.

DoubleWord 1 - X-Axis Z Gradient

31-0 X-Axis Z Gradient

Gradient of Z along the X axis over the primitive surface. Signed 25.7 number.

DoubleWord 2 - Y-Axis Z Gradient

31-0 Y-Axis Z Gradient

Gradient of Z along the Y axis over the primitive surface. Signed 25.7 number.

DoubleWord 3 – Minimum Z Threshold

31-24 Reservedignored

23-0 Minimum Z Threshold

Minimum of Z threshold. Unsigned 24-bit integer.

DoubleWord 4 - Maximum Z Threshold

31-24 Reserved ignored

23-0 Maximum Z Threshold

Maximum of Z threshold. Unsigned 24-bit integer.

Texture Coordinate Parameters

Texture parameters are used for texture mapping. They consist of starting values, incremental along the X and Y axis.

DoubleWord 0 - Initial U Value

31-0 Initial U Value

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

DoubleWord 1 - Initial U Value

31-0 Initial U Value

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

DoubleWord 2 - X-Axis U Gradient

31-0 X-Axis U Gradient

Gradient of U along the X axis over the primitive surface. Signed 16.16 number.

DoubleWord 3 – Y-Axis U Gradient

31-0 Y-Axis U Gradient

Gradient of U along the Y axis over the primitive surface. Signed 16.16 number.

DoubleWord 4 - X-Axis V Gradient

31-0 X-Axis V Gradient

Gradient of V along the X axis over the primitive surface. Signed 16.16 number.

DoubleWord 5 - Y-Axis V Gradient

31-0 Y-Axis V Gradient

Gradient of V along the Y axis over the primitive surface. Signed 16.16 number.

Perspective Factor Parameters

Perspective factor parameters are used for perspective corrected texture mapping. They consist of W starting values incremental along the X and Y axis.

DoubleWord 0 - Initial W Value

31-0 Initial W Value

Initial W value on main edge (left edge of trapezoid or long edge of triangle). Signed 4.28 integer.

DoubleWord 1 - X-Axis W Gradient

31-0 X-Axis W Gradient

Gradient of W along the X axis over the primitive surface. Signed 4.28 number.

DoubleWord 2 - Y-Axis W Gradient

31-0 Y-Axis W Gradient

Gradient of W along the Y axis over the primitive surface. Signed 4.28 number.

Specular / Fog Start Value

The specular / fog start value is used for specular shading or fogging.

DoubleWord 0 - Start Value

31-24 Initial Fog Value

Initial Fog value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

23-16 Initial Red Value

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

15-8 Initial Green Value

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

7-0 Initial Blue Value

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

Specular Parameters

Specular parameters are used for specular shading. These parameters are not present in flat color mode and consist of starting values incremental along the main direction ((dx, dy) = (M1, 1)), and incremental along the X axis.

DoubleWord 0 - X-Axis Blue Gradient

31-0 X-Axis Blue Gradient

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 1 - Y-Axis Blue Gradient

31-0 Y-Axis Blue Gradient

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 2 - X-Axis Green Gradient

31-0 X-Axis Green Gradient

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 3 - Y-Axis Green Gradient

31-0 Y-Axis Green Gradient

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 4 - X-Axis Red Gradient

31-0 X-Axis Red Gradient

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 5 - Y-Axis Red Gradient

31-0 Y-Axis Red Gradient

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

Fog Parameters

Fog parameters are used for fogging. These parameters are not present in flat color mode and consist of starting values incremental along the X and Y axis.

DoubleWord 0 - X-Axis Fog Gradient

31-0 X-Axis Fog Gradient

Gradient of Fog along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 1 - Y-Axis Fog Gradient

31-0 Y-Axis Fog Gradient

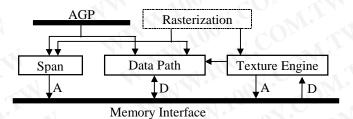

Gradient of Fog along the Y axis over the primitive surface. Signed 20.12 number.

Pixel Engine Registers

The major responsibilities of the Pixel Engine are to perform per-pixel operations and to control data flow and its sequence.

The Pixel engine interfaces to the Rasterization Engine and the host to accept data. It also interfaces to the Memory Interface to access video memory. Inside the Pixel Engine, there are several blocks: the Span Engine, the Data Path, and the Texture Engine. Operation of the Data Path and the Texture Engine are under control of the Span Engine. The Memory Interface accepts memory access requests from the Pixel Engine, translates the address into a linear address, and executes the requests.

The 0 - FFh "Engine" register address space is partitioned into six sections:

| 0 - 0Fh | Span Engine |
|----------|--|
| 10 - 2Fh | VGA core |
| 30 - 3Fh | Unified Rasterization and Setup Engine |
| 44 - 9Fh | Pixel Engine |
| A0 - AFh | Texture Engine |
| B0 - BFh | Command List Control Unit |
| C0 – FFh | Memory Interface |
| | |

Addresses 40h - FFh are also used for sequential loading overlapping with other registers in this space. Addresses 10000 - 1FFFFh are used as a data port area.

Data from the Host

The Pixel Engine can accept data from the host through either the 32-bit data port register at 9Ch or data in the 1xxxh address space. Software passes only enough DWORDs to hardware. Software doesn't pack data to 64-bit boundaries. It only packs to 32-bit boundaries. For bitblts, packing is done per-scanline. I.e., for every scanline, the host will send just enough DWORDs to the engine. For text, packing is done per-command. I.e., the scanline may be broken inside a DWORD. For a string of texts, the number of DWORDs of data passed to the Graphic Engine can be odd numbers except for the last character. For the last character, software should pass either an even number of DWORDs (by padding a garbage DWORD as necessary) or by setting a drawing environment register after all data is sent.

GEbase + 44 - Drawing Command.....RW

Writing to the Drawing Command register starts a drawing operation. When this register is set, the drawing environment registers and memory interface registers are locked in. Any change to these registers will not affect this drawing operation. Furthermore, the Pixel Engine will not accept any data from the host or from the Rasterization Engine without a drawing command. After a drawing command is issued, the Pixel Engine will selectively accept data from the host or Rasterization Engine depending on the command. Specifically, the Pixel Engine only accepts data from the host if the command is text or blt and the BS field indicates the source is from the host. The Pixel Engine only accepts data (scanlines, Z, color, etc.) from the Rasterization Engine if the command is line or polygon.

Texture Engine Registers

The texture Engine handles texture access and filtering. It is controlled by the Span Engine. It accepts texture coordinates from the Rasterization Engine, generates and passes addresses to the Memory Interface, accepts raw texel data from the Memory Interface, does filtering, and passes the results to the Data Path.

GEbase + A0 - Texture Control.....RW

Textures are aligned to 64-bit boundaries on a scanline basis.

31 Texture Access Control

- 0 Disable (use cache)
- 1 Enable (bypass cache)

30 Filtering Control

- O Filter with color key. Treat alpha value for keyed texels as 0
- 1 Downgrade filtering function based on fractional bits of UV and key test result. Set alpha to 0 for keyed texels.

29-28 Texture U Boundary Checking Function

- 00 Texture U wraparound
- 01 Texture U mirroring
- 10 Texture U clamping
- 11 -reserved-

27-26 Texture V Boundary

- 00 Texture V wraparound

11-8 Texture Map Levels (TML) (Range 0-8)

The number of maps in the MipMap (0 = 1 map)

7-4 Y-Axis Texture Memory Size (TRY) (Range 0-8) This field determines the number of lsb's (2**TRY) of parameter V to be used in the Y axis. Any bit higher than this will be ignored (wraparound).

3-0 X-Axis Texture Memory Size (TRX) (Range 0-8)
This field determines the number of lsb's (2**TRX) of parameter U to be used in the X axis. Any bit higher than this will be ignored (wraparound).

Note: For MipMap textures, TRX/TRY is the size of the original texture (1:1 map)

GEbase + A4 - Texture ColorRW

31-24 Alpha

Constant alpha value when there is no alpha in the texture format

23-0 Texture Color Key

Texture transparency color (888 RGB)

GEbase + A8 - Texture Palette Data......WO

31-16 Texel n+1

15-0 Texel n

An internal counter is used in loading the texture palette. Writing to the Texture register (GEbase+A0) resets the counter to 0. Writing to the Texture Palette Data register writes the data to the place pointed to by the counter then increments the counter by 1. Each write writes two entries into the palette.

GEbase + AC - Texture BoundaryRW

- 101 20% LOD dithering
- 11x -reserved-

Texture Filtering

Texture data read back from the Memory Interface first goes through palette translation if the texture is palettized. The texture is then converted into common internal 8888 ARGB format. If the texture doesn't have alpha data, then a constant alpha value is used. If the texture color key is enabled and the texture color matches the key, set alpha to 0. Bi-linear or trilinear filtering is then performed on RGB and alpha. If the color key is enabled and the result alpha is 0, the corresponding pixel should be discarded. This is done by attaching a validity bit with texture data passed from the Texture Engine to the Data Path. It should be noted that filtering depends on the LOD value. When LOD < 0, a different filter may be applied. In bi-linear filtering, if the texel nearest to the texture coordinate is masked by the color key, then the texel is considered as masked. Otherwise, the texel is considered not masked.

Memory Interface Registers

The registers in this group include stride and buffer base address registers for frame buffer control. There are three base addresses: source base address (added to blt source), destination base address (added to color destination), and Z base address (added to Z addresses).

| <u>GEbase + B8 – Destination Stride / Buffer Base 0</u> | RW |
|---|----|
| <u>GEbase + BC – Destination Stride / Buffer Base 1</u> | RW |

31-0 Texture Base Address (in bytes)

Base addresses always start on QWORD boundaries so bits 2-0 are always 0.

GEbase + 10000-1FFFFh - Data Port AreaRW

FUNCTIONAL DESCRIPTIONS

System Configuration

The Apollo ProMedia has several modes that are required to be determined at reset time. This includes DFP monitor modes for selecting the correct display device and test modes to assist in board debug and trouble-shooting for manufacturing.

DFP Interface Configuration

The Apollo ProMedia uses the MA[6] pin in conjunction with the RESET# pine to select if the DFP interface is ON or OFF. This is primarily used for test purposes.

| LCD On/Off Mode | MA[6] |
|-----------------|-------|
| LCD OFF | 0 |
| LCD ON | 1 |

The LCD type is selected by MA[5-3]:

| LCD Type | LCD Resolution | MA[5-3] |
|----------|----------------------|---------|
| TFT | 1024 x 768 x 18-bit | 000 |
| TFT | 1280 x 1024 x 18-bit | 001 |
| TFT | 800 x 600 x 18-bit | 010 |
| TFT | 1024 x 600 x 18-bit | 011 |
| DSTN | 1024 x 768 x 16-bit | 100 |
| DSTN | 1024 x 600 x 24-bit | 101 |
| DSTN | 800 x 600 x 16-bit | 110 |
| DSTN | 1024 x 768 x 24-bit | 111 |

Graphics Controller Power Management

The ProMedia Graphics Controller power management feature set complies with AGP and PCI power management requirements.

Power Management States

Power management states (D0-D3) for both ACPI and PCI Bus Power Management (PCI PM) refer to the same states described in the Device Class PM Reference Specification for Display Devices, which are equivalent to the VESATM DPMS power states. System software should access the ProMedia's configuration registers to perform PCI PM state transitions.

Table 12. PCI Power Management States

| PCI PM State | Desktop Graphics | Notebook Graphics |
|-----------------|-------------------------------------|--|
| State 0 (D0) | DPMS State 0 Fully On | Proprietary State 0 Fully On |
| State 1 (D1) | DPMS State 1 Standby (Hsync Off) | Proprietary State 1 Standby (VCLK Off) |
| State 2 (D2) | DPMS State 2 Suspend (Vsync Off) | Proprietary State 2 Suspend (MCLK/VCLK Both Off) |
| State 3 (D3) | DPMS State 3 Off (H/Vsync Both Off) | Same as State 2 |

Power Management Clock Control

If the system "South Bridge" sends a request to the ProMedia to power down the memory controller, the ProMedia first uses CLKRUN# (the same signal appearing external to the ProMedia) to check to see if the internal graphics controller needs to access main memory. The graphics controller logic will detect CLKRUN# high for 2 or 3 PCICLK's and check if there are any:

Internal buffers not emptied PCI Master or AGP Master actions pending

If either condition exists, the graphics controller logic will assert CLKRUN# low for 2 PCICLK's to signal the clock generator to keep PCICLK running.

PME# is not implemented since there are no wake-up conditions.

Power Management Registers

Power management control for the ProMedia Graphics Controller is provided by extended registers SR24 (Power Management Control), GR20 (Standby Timer Control), GR21 (Power Management Control 1), GR22 (Power Management Control 2), GR23 (Power Status), GR24 (Soft Power Control), GR25 (Power Control Select), GR26 (DPMS Control), GR27-28 (GPIO Control), GR2A (Suspend Pin Timer), GR2C (Miscellaneous Pin Control), GR2F (Miscellaneous Internal Control), and Graphics Controller PCI Configuration Indices 90-97 (PCI Power Management Registers 1 and 2).

ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

Table 13. Absolute Maximum Ratings

| Symbol | Parameter | Min | Max | Unit | Notes |
|------------------|-------------------------------|------|-------------------|-------|-------|
| T_{A} | Ambient operating temperature | 0 | 70 | oC | 1 |
| T_{S} | Storage temperature | -55 | 125 | oC | 1 |
| V_{IN} | Input voltage | -0.5 | $V_{RAIL} + 10\%$ | Volts | 1, 2 |
| V _{OUT} | Output voltage | -0.5 | $V_{RAIL} + 10\%$ | Volts | 1, 2 |

Note 1: Stress above the conditions listed may cause permanent damage to the device. Functional operation of this device should be restricted to the conditions described under operating conditions.

Note 2. V_{RAIL} is defined as the V_{CC} level of the respective rail. The CPU interface can be 3.3V or 2.5V. Memory can be 3.3V only. PCI can be 3.3V or 5.0V. Video can be 3.3V or 5.0V. Flat Panel can be 3.3V only.

DC Characteristics

 $\overline{T_A = 0.70^{\circ}C, V_{RAIL} = V_{CC}} + /-5\%, V_{CORE} = 2.5V + /-5\%, GND=0V$

Table 14. DC Characteristics

| Symbol | Parameter | Min | Max | Unit | Condition |
|-------------------|--------------------------|-------|----------------------|------|--|
| $V_{ m IL}$ | Input Low Voltage | -0.50 | 0.8 | V | |
| V_{IH} | Input High Voltage | 2.0 | V _{CC} +0.5 | V | |
| V_{OL} | Output Low Voltage | 00- | 0.55 | V | I _{OL} =4.0mA |
| V _{OH} | Output High Voltage | 2.4 | -01 | V | I _{OH} =-1.0mA |
| $I_{ m IL}$ | Input Leakage Current | 1.1- | +/-10 | uA | $0 < V_{IN} < V_{CC}$ |
| I _{OZ} | Tristate Leakage Current | 1-10 | +/-20 | uA | 0.55 <v<sub>OUT<v<sub>CC</v<sub></v<sub> |
| I_{CC} | Power Supply Current | - | 00% | mA | |

AC Timing Specifications

AC timing specifications provided are based on external zero-pf capacitance load. Min/max cases are based on the following table.

Table 15. AC Timing Min / Max Conditions

| Parameter | Min | Max | Unit |
|-------------|-------|-------|-------|
| 5.0V Power | 4.75 | 5.25 | Volts |
| 3.3V Power | 3.135 | 3.465 | Volts |
| 2.5V Power | 2.375 | 2.625 | Volts |
| Temperature | 0 | 70 | oC |

Drive strength for selected output pins is programmable. See Rx6D for details.
